

MOSFET H-Bridge Shrinks Footprint

Diodes Incorporated has extended its family of dedicated MOSFET H-bridges with the DMHC3025LSD and DMHC4035LSD designed for space limited single-phase brush and brushless motor driving and inductive wireless charging circuits.

These 30V and 40V rated MOSFETs have low $R_{DS(on)}$ performance allowing them to operate under a high 70°C ambient temperature, whilst still supporting continuous currents of 3A and 2A respectively, thereby accommodating worst-case motor stall currents.

For samples and quotations please contact your nearest Diodes sales office or representative.

The Diodes Advantage

The MOSFET H-bridges co-package 2x nMOS and 2x pMOS that can replace four single devices or two sets of complementary devices.

Reduce Footprint

Using single SO8 package, with 5mm x 6mm footprint, these H-bridges can save PCB space, reduce component count, and assembly costs.

Low $R_{DS(on)}$

<50m Ω minimises conduction losses enabling the H-bridges to tolerate high continuous current under motor stall conditions.

High Pulsed Current

30A peak pulse capability allows for a high in-rush current to be drawn safely during the start-up of the inductive load.

Max Drain Voltage

40V and 30V V_{DSS} provides sufficient headroom for the intended 24V and 12V V_{CC} rail voltages.

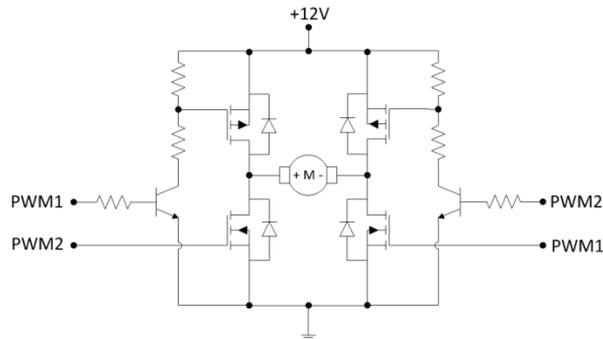

Applications

Full H-bridge commonly found with 12V and 24V rails which includes:

- Brushed DC Motors
- Single Phase Brushless DC (BLDC) Motors
- Inductive Wireless Charging

H-bridge Motor Driving Application

Typical 12V full H-Bridge driving a brushed DC motor

MOSFET H-Bridge Portfolio

Part Number	Polarity	V _{DSS} (V)	V _{GSS} (V)	I _D (A)	I _{DM} (A)	R _{DS(on)} max @4.5V (mΩ)	R _{DS(on)} max @10V (mΩ)	Q _g typ @10V (nC)
