

**13-Output Low-Power Fanout Clock Buffer for PCIe 6.0 Application**

**Description**

The PI6CB332013A is a low-power PCIe® 5.0/6.0 clock buffer. It takes a reference input to fanout 13 low-power differential HCSL outputs up to 400MHz, with on-chip terminations for 85Ω or 100Ω output impedance. An individual OE pin for each output provides easier power management. The device also supports Power Down Tolerant (PDT), automatic output clock parking upon loss of input clock, and Flexible Startup Sequencing features.

**Block Diagram**

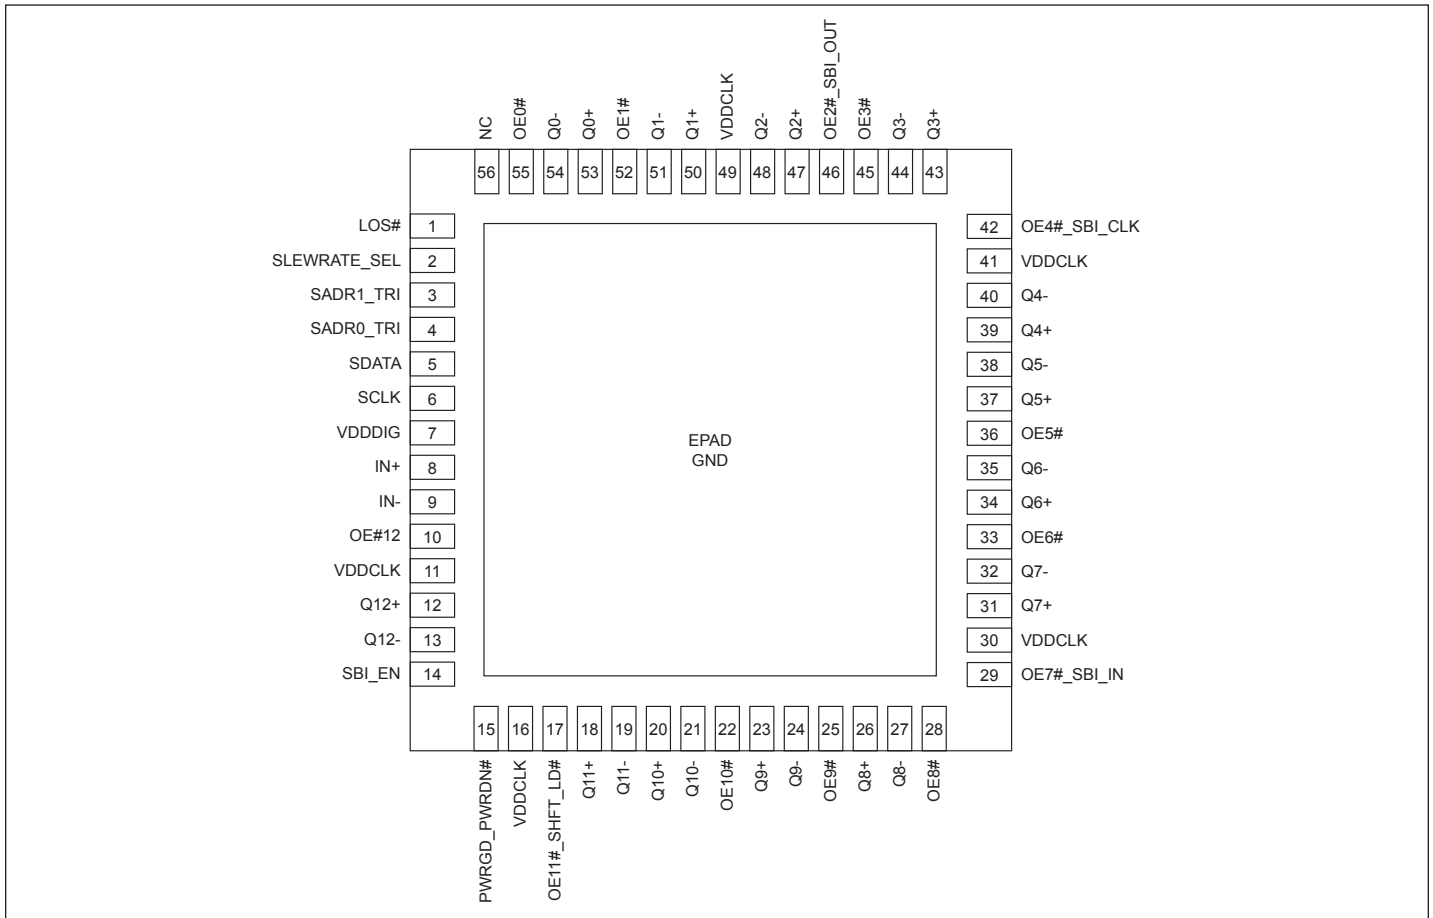

**Features**

- 13 Low-Power HCSL Outputs with On-Chip Termination
- 85Ω or 100Ω Output Impedance
- Individual Output Enable
- Supports I/O Power Down Tolerant
- Flexible Startup Power Sequencing
- Automatic Output Clock Parking Upon Loss of Input Clock
- Up to 9 Selectable SMBus Addresses
- Supports SBI OE# Interface
- Differential Output-to-Output Skew <50ps
- Additive Phase Jitter
  - PCIe 5.0: Typical 5fs RMS
  - PCIe 6.0: Typical 3fs RMS
  - DB2000QL: Typical 10fs RMS
- 3.3V Supply Voltage
- Temperature Range: -40°C to 105°C
- Packaging (Pb-free & Green):
  - 56-VQFN, 7mm × 7mm (ZLF)
- Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)
- Halogen and Antimony Free. “Green” Device (Note 3)
- For automotive applications requiring specific change control (i.e. parts qualified to AEC-Q100/101/104/200, PPAP capable, and manufactured in IATF 16949 certified facilities), please [contact us](mailto:contact@diodes.com) or your local Diodes representative. <https://www.diodes.com/quality/product-definitions/>

**Notes:**

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated’s definitions of Halogen- and Antimony-free, “Green” and Lead-free.
3. Halogen- and Antimony-free “Green” products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

## Pin Configuration

## Pin Description

Pin Number	Pin Name	Type		Description
1	LOS#	Output	Open Drain	Open drain output, needs external pull up, Low output indicates loss of input clock signal, PDT
2	SLEWRATE_SEL	Input	CMOS	Input to select default slew rate of the outputs. 0 = Slow Slew Rate, 1 = Fast Slew Rate. Internal pull up.
3	SADR1_tri	Input	Tri-level	SMBus address bit. This is a tri-level input that works in conjunction with SADR0_tri pin, to decode SMBus addresses. It has internal pull-up/down resistors to bias to VDD/2. See the SMBus Address Selection table.
4	SADR0_tri	Input	Tri-level	SMBus address bit. This is a tri-level input that works in conjunction with SADR1_tri pin, to decode SMBus addresses. It has internal pull-up/down resistors to bias to VDD/2. See the SMBus Address Selection table.
5	SDATA	I/O	CMOS	Data pin for SMBus interface.
6	SCLK	Input	CMOS	Clock pin of SMBus interface.

Pin Number	Pin Name	Type		Description
7	VDDDIG	Power		Digital power.
8	IN+	Input	Diff.	True clock input. PDT. Internal pull down.
9	IN-	Input	Diff.	Complementary clock input. Internal pull up.
10	OE12#	Input	CMOS	Active low input for enabling output 12. 0 = Enable output, 1 = Disable output. Internal pull up, PDT.
11	VDDCLK	Power		Clock power supply.
12	Q12+	Output	Diff.	True clock output.
13	Q12-	Output	Diff.	Complementary clock output.
14	SBI_EN	Input	CMOS	0 = SBI is disabled. 1 = SBI is enabled. Internal pull down, PDT.
15	PWRGD_PWRDN#	Input	CMOS	1 = power good mode, I2C address is latched. 0 = power down mode. Internal pull up, PDT.
16	VDDCLK	Power		Clock Power supply.
17	OE11#_SHFT_LD#	Input	CMOS	SBI_EN=0: OE mode 0 = Enable output, 1 = Disable Output SBI_EN=1: SBI mode This pin becomes SHFT_LD pin. For both OE mode and SBI mode, Internal pull up, PDT.
18	Q11+	Output	Diff.	True clock output.
19	Q11-	Output	Diff.	Complementary clock output.
20	Q10+	Output	Diff.	True clock output.
21	Q10-	Output	Diff.	Complementary clock output.
22	OE10#	Input	CMOS	Active low input for enabling output 10. 0 = Enable output, 1 = Disable output. Internal pull up, PDT.
23	Q9+	Output	Diff.	True clock output.
24	Q9-	Output	Diff.	Complementary clock output.
25	OE9#	Input	CMOS	Active low input for enabling output 9. 0 = Enable output, 1 = Disable output. Internal pull up, PDT.
26	Q8+	Output	Diff.	True clock output.
27	Q8-	Output	Diff.	Complementary clock output.
28	OE8#	Input	CMOS	Active low input for enabling output 8. 0 = Enable output, 1 = Disable output. Internal pull up, PDT.
29	OE7#_SBI_IN	Input	CMOS	SBI_EN=0: OE mode 0 = Enable output 7, 1 = Disable output 7 SBI_EN=1: SBI mode This pin becomes SBI_IN pin For both OE mode and SBI mode, Internal pull up, PDT.
30	VDDCLK	Power		Clock power supply.

## Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Storage Temperature.....	-65°C to +150°C
Supply Voltage to Ground Potential, $V_{DDXX}$ .....	-0.5V to +3.9V
Input Voltage .....	-0.5V to $V_{DD} + 0.3V$ , not exceed 3.9V
Input Voltage (PDT Pin) .....	-0.5V to +3.9V
ESD Protection (HBM) .....	2000V
Iout (Output Current Continuous) .....	30mA
Iout (Output Current Surge).....	60mA
Junction Temperature .....	150°C

**Note:**

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## SMBus Serial Data Interface

PI6CB332013A is a slave only device that supports block and byte protocol using a single 7-bit address and read/write bit as shown below. The highest bit of register address is to distinguish block write/read and byte write/read. when the highest bit is "1", it's the byte operation, the highest bit is "0", it's the block operation.

Read and write block transfers can be stopped after any complete byte transfer.

## Side-Band Interface

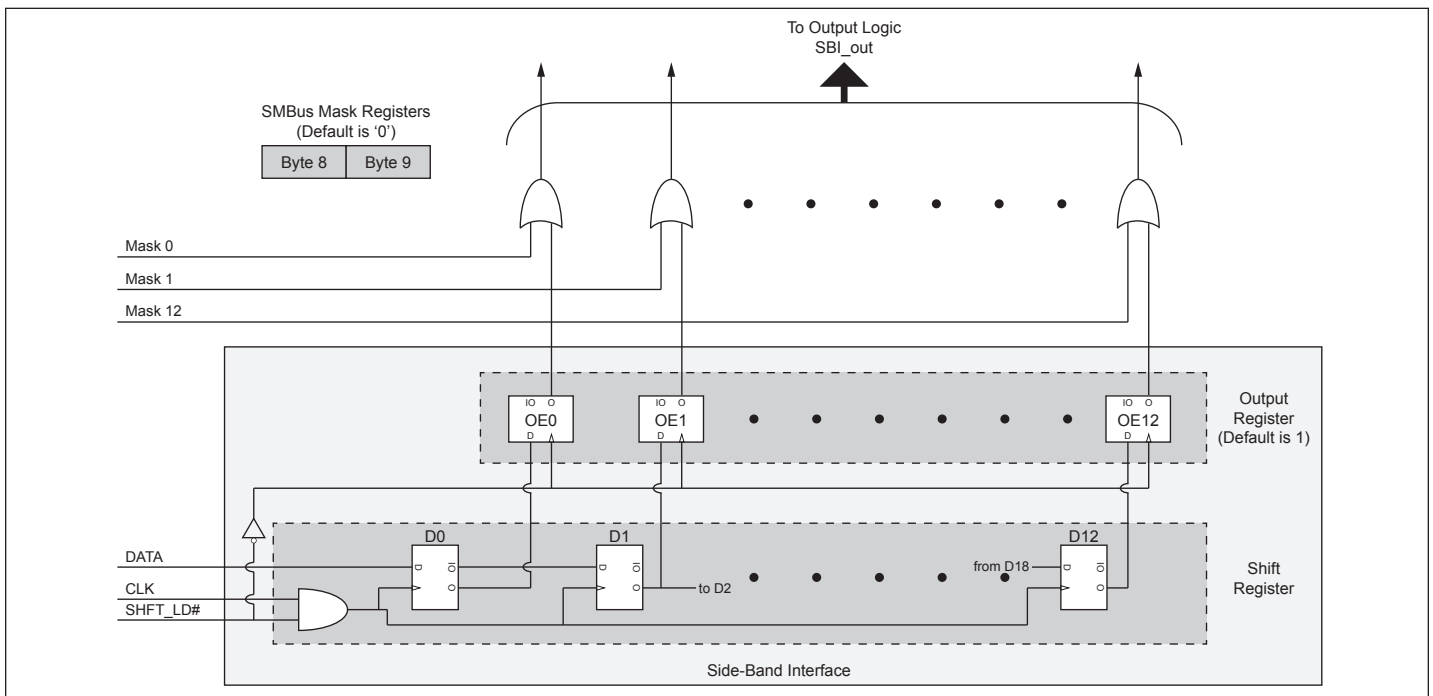

This interface consists of DATA, CLK and SHFT\_LD# pins. When the SHFT\_LD# pin is high, the rising edge of CLK can shift DATA into the shift register. After shifting data, the falling edge of SHFT\_LD# clocks the shift register contents to the Output register.

When the SBI is enabled, DATA, CLK, and SHFT\_LD# are enabled on OE7#, OE4# and OE11# respectively. Additionally, SMBus registers for masking off the disable function of the shift register (0 value of a bit) become active. When set to a one, the mask register forces its respective output to 'enabled.' This prevents accidentally disabling critical outputs when using the SBI.

An SMBus read back bit in Byte 4 indicates which output enable control interface is enabled.

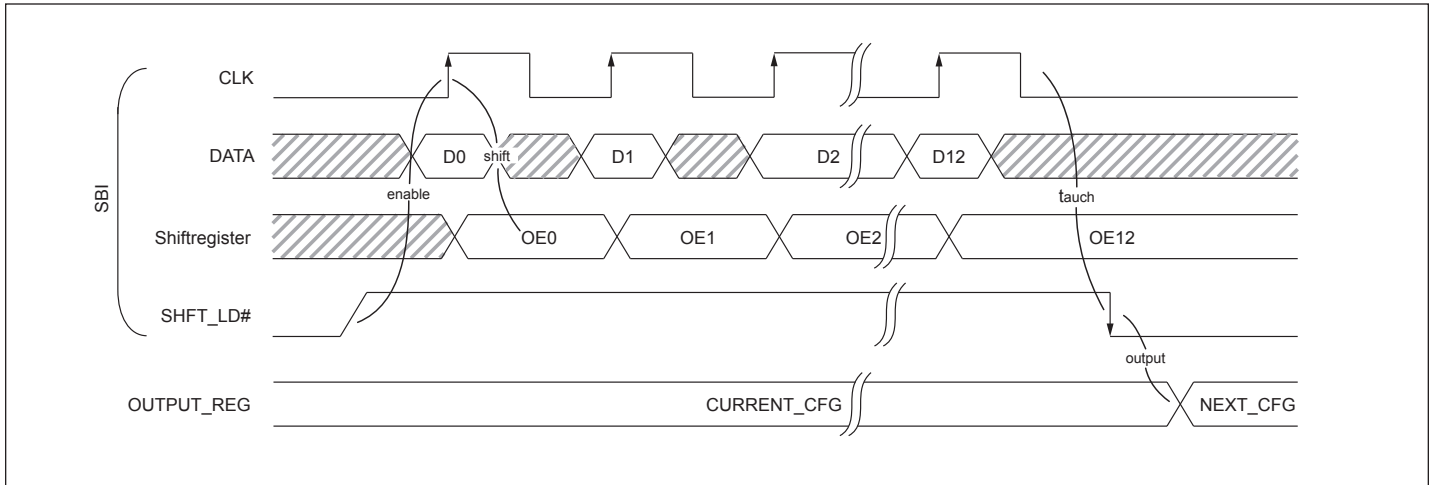

When the SBI is enabled, and power has been applied, the SBI is active, even if the PWRGD/PWRDN# pin indicates the part is in power down. This allows loading the shift register and transferring the contents to the output register before the assertion of PWRGD. Note that the mask registers are part of the normal SMBus interface and cannot be accessed when the PWRGD/PWRDN# is low. Figure 2 provides a functional description of the SBI.

The SBI and the traditional SMBus output enable registers both default to the 'output enabled' state at power-up. The mask registers default to zero at power-up, allowing the shift bits to disable their respective output. See Figure 2.

**Figure 2. Side Band Interface Control Logic Description**

Figure 3 shows the basic timing of the side-band interface. The SHFT\_LD# pin goes high to enable the CLK input. Next, the rising edge of CLK clocks enable DATA into the shift register. After the 13th clock for output 13, stop the clock low and drive the SHFT\_LD# pin low. The falling edge of SHFT\_LD# clocks the shift register contents to the output register, enabling or disabling the outputs. Always shift 13 bits of data into the shift register to control the outputs.

**Figure 3. Side Band Interface Functional Timing**

The SBI interface supports clock rates up to 10MHz. Multiple devices may share CLK and DATA pins. Dedicating a SHFT\_LD# pin to each devices allows its use as a chip-select pin. When the SHFT\_LD# pin is low, the PI6CB3320xx ignores any activity on the CLK and DATA pins.

## Applications Information

### Power Down Tolerant Pins

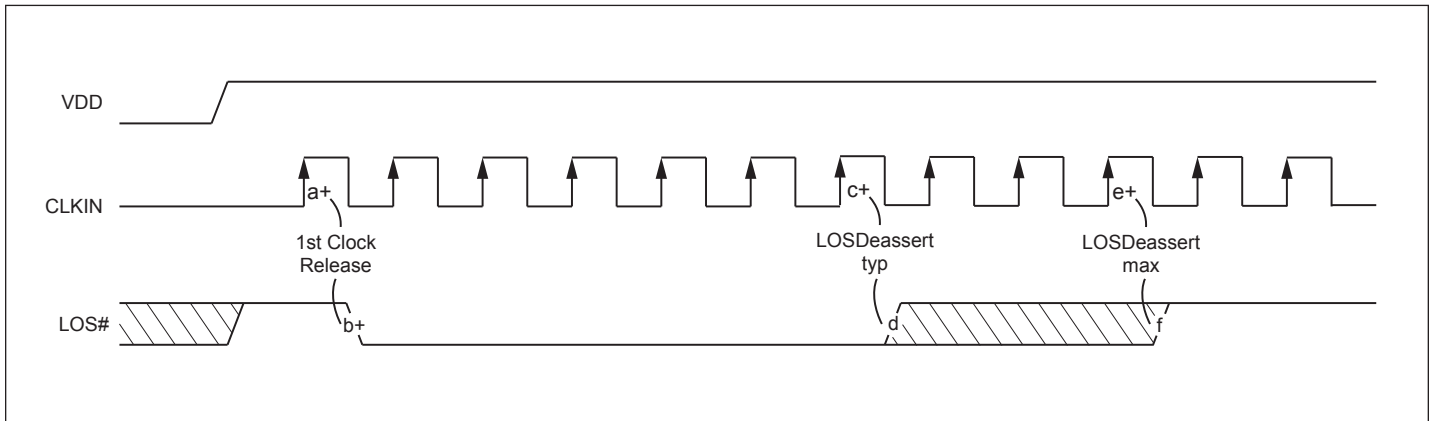

Pins that are Power Down Tolerant (PDT) can be driven by voltages as high as the normal VDD of the chip, even though VDD is not present (the device is not powered). There will be no ill effects to the device and it will power up normally. This feature supports disaggregation, where the PI6CB3320xx may be on one circuit board and devices that interface with it are on other boards. These boards may power up at different times, driving pins on the PI6CB3320xx before it has received power.

### Flexible Startup Sequencing

PI6CB3320xx devices support Flexible Startup Sequencing (FSS), IN+/- pins are PDT. FSS allows application of CLKIN at different times in the device/system startup sequence. FSS is an additional feature that helps the system designer manage the impact of disaggregation. Table shows the supported sequences; that is, the PI6CB3320xx devices can have CLKIN running before VDD is applied, and can have VDD applied and sit for extended periods with no input clock.

### Loss of Signal and Automatic Clock Parking

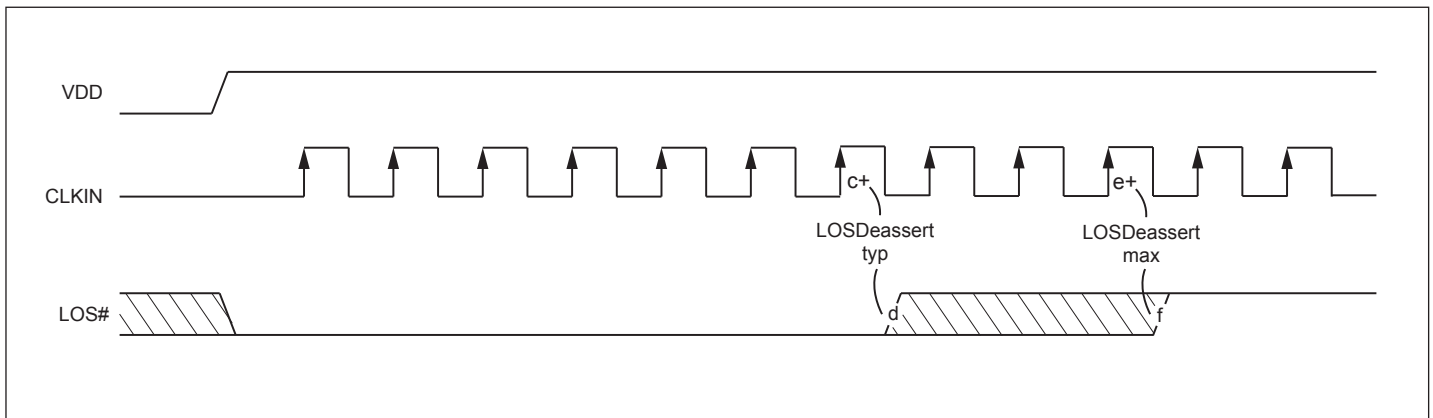

The PI6CB3320xx buffers have a Loss of Signal (LOS) circuit to detect the presence or absence of an input clock. The LOS circuit drives the open-drain LOS# pin (the “#” suffix indicates “bar”, or active-low) and sets the LOS\_EVT bit in the SMBus register space. There are two slightly different LOS# pin behaviors at power up. Figure 4 and Figure 5 show the LOS# de-assertion timing for the 4, 8, 13, 16 and 20-output buffers. CLKIN is represented differentially in Figure 4 and Figure 5.

**Figure 4. LOS# De-assert Timing for 4/8/13/16 Outputs**

Note: The LOS circuit on the 13-output buffer requires a CLKIN edge to release the LOS# pin after power up. So, the LOS# pin will be high until the first clock edge after power up.

Figure 5 shows the LOS# de-assertion timing for the 20-output buffers. LOS# on the 20-output buffers defaults to low at power up.

**Figure 5. LOS# De-assert Timing for 20 Outputs**

The following diagram shows the LOS# assertion sequence when the CLKIN is lost. It also shows the Automatic Clock Parking (ACP) circuit bring the inputs to a Low/Low state after an LOS event. For exact timing, see Electrical Characteristics.

**Notes:**

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.
4. A = For 85Ω output impedance, A100 = For 100Ω output impedance
5. E = Pb-free and Green
6. X suffix = Tape/Reel
