**IMPORTANT NOTICE**

1. DIODES INCORPORATED (Diodes) AND ITS SUBSIDIARIES MAKE NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARDS TO ANY INFORMATION CONTAINED IN THIS DOCUMENT, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION).
2. The Information contained herein is for informational purpose only and is provided only to illustrate the operation of Diodes' products described herein and application examples. Diodes does not assume any liability arising out of the application or use of this document or any product described herein. This document is intended for skilled and technically trained engineering customers and users who design with Diodes' products. Diodes' products may be used to facilitate safety-related applications; however, in all instances customers and users are responsible for (a) selecting the appropriate Diodes products for their applications, (b) evaluating the suitability of Diodes' products for their intended applications, (c) ensuring their applications, which incorporate Diodes' products, comply the applicable legal and regulatory requirements as well as safety and functional-safety related standards, and (d) ensuring they design with appropriate safeguards (including testing, validation, quality control techniques, redundancy, malfunction prevention, and appropriate treatment for aging degradation) to minimize the risks associated with their applications.
3. Diodes assumes no liability for any application-related information, support, assistance or feedback that may be provided by Diodes from time to time. Any customer or user of this document or products described herein will assume all risks and liabilities associated with such use, and will hold Diodes and all companies whose products are represented herein or on Diodes' websites, harmless against all damages and liabilities.
4. Products described herein may be covered by one or more United States, international or foreign patents and pending patent applications. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks and trademark applications. Diodes does not convey any license under any of its intellectual property rights or the rights of any third parties (including third parties whose products and services may be described in this document or on Diodes' website) under this document.
5. Diodes' products are provided subject to Diodes' Standard Terms and Conditions of Sale (<https://www.diodes.com/about/company/terms-and-conditions/terms-and-conditions-of-sales/>) or other applicable terms. This document does not alter or expand the applicable warranties provided by Diodes. Diodes does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel.
6. Diodes' products and technology may not be used for or incorporated into any products or systems whose manufacture, use or sale is prohibited under any applicable laws and regulations. Should customers or users use Diodes' products in contravention of any applicable laws or regulations, or for any unintended or unauthorized application, customers and users will (a) be solely responsible for any damages, losses or penalties arising in connection therewith or as a result thereof, and (b) indemnify and hold Diodes and its representatives and agents harmless against any and all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim relating to any noncompliance with the applicable laws and regulations, as well as any unintended or unauthorized application.
7. While efforts have been made to ensure the information contained in this document is accurate, complete and current, it may contain technical inaccuracies, omissions and typographical errors. Diodes does not warrant that information contained in this document is error-free and Diodes is under no obligation to update or otherwise correct this information. Notwithstanding the foregoing, Diodes reserves the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes.
8. Any unauthorized copying, modification, distribution, transmission, display or other use of this document (or any portion hereof) is prohibited. Diodes assumes no responsibility for any losses incurred by the customers or users or any third parties arising from any such unauthorized use.
9. This Notice may be periodically updated with the most recent version available at <https://www.diodes.com/about/company/terms-and-conditions/important-notice>

# TABLE OF CONTENTS

|          |  |           |
|----------|--|-----------|
| <b>1</b> | <b>INTRODUCTION .....</b>                                  | <b>23</b> |
| 1.1      | KEY FEATURES .....   | 24        |
| <b>2</b> | <b>GENERAL DESCRIPTION .....</b>                           | <b>26</b> |
| <b>3</b> | <b>PIN DESCRIPTION .....</b>                               | <b>28</b> |
| 3.1      | PCI EXPRESS INTERFACE SIGNALS .....                        | 28        |
| 3.2      | CONFIGURATION STRAPPING SIGNALS .....                      | 28        |
| 3.3      | HOT PLUG SIGNALS .....                                     | 29        |
| 3.4      | REFERENCE CLOCK OUTPUT AND CONTROL SIGNALS .....           | 30        |
| 3.5      | SIDE BAND MANAGEMENT SIGNALS .....                         | 31        |
| 3.6      | MISCELLANEOUS CONTROL AND STATUS .....                     | 31        |
| 3.7      | JTAG BOUNDARY SCAN SIGNALS .....                           | 32        |
| 3.8      | POWER PINS .....   | 32        |
| <b>4</b> | <b>FUNCTIONAL OVERVIEW .....</b>                           | <b>34</b> |
| 4.1      | MODES OF OPERATIONS .....                                  | 34        |
| 4.1.1    | BASE MODE (FAN-OUT MODE) .....                             | 34        |
| 4.1.2    | Cross-Domain End-Point Mode .....                          | 34        |
| 4.2      | PHYSICAL LAYER CIRCUITS .....                              | 35        |
| 4.2.1    | PHY CONTROL REGISTER PARALLEL INTERFACE ACCESS .....       | 35        |
| 4.2.1.1  | Read Procedures .....                                      | 36        |
| 4.2.1.2  | Write Procedures .....                                     | 37        |
| 4.3      | MEDIA ACCESS CONTROL (MAC) .....                           | 37        |
| 4.4      | DATA LINK LAYER (DLL) .....                                | 37        |
| 4.5      | TRANSACTION LAYER RECEIVE BLOCK (TLP DECAPSULATION) .....  | 38        |
| 4.6      | ROUTING .....  | 38        |
| 4.7      | QUEUE .....  | 38        |
| 4.7.1    | POSTED REQUEST HEADER (PH) .....                           | 39        |
| 4.7.2    | POST REQUEST DATA (PD) .....                               | 39        |
| 4.7.3    | NON-POSTED REQUEST HEADER AND DATA (NPHD) .....            | 39        |
| 4.7.4    | COMPLETION HEADER (CPLH) .....                             | 39        |
| 4.7.5    | COMPLETION DATA (CPLD) .....                               | 39        |
| 4.8      | TRANSACTION ORDERING .....                                 | 39        |
| 4.9      | PORT ARBITRATION .....                                     | 40        |
| 4.10     | FLOW CONTROL .....   | 40        |
| 4.11     | TRANSACTION LAYER TRANSMIT BLOCK (TLP ENCAPSULATION) ..... | 41        |
| 4.12     | ACCESS CONTROL SERVICE (ACS) .....                         | 41        |
| 4.13     | MULTICAST OPERATION .....                                  | 41        |
| <b>5</b> | <b>CHIP INITIALIZATION .....</b>                           | <b>42</b> |
| 5.1      | PORT-LANE CONFIGURATION .....                              | 42        |
| 5.1.1    | MODE SELECTION .....                                       | 42        |
| 5.1.2    | LANE MAPPING .....   | 42        |
| 5.1.3    | PORT NUMERING .....  | 42        |
| 5.1.4    | PORT-LANE MAPPING .....                                    | 43        |
| 5.2      | CLOCK SCHEME .....   | 43        |
| 5.2.1    | REFERENCE CLOCK OPERATION MODES .....                      | 43        |
| 5.2.2    | INTEGRATED REFERENCE CLOCK BUFFER .....                    | 44        |
| 5.3      | EEPROM INTERFACE .....                                     | 45        |
| 5.3.1    | EEPROM ACCESS MODES .....                                  | 45        |

|          |  |           |
|----------|--|-----------|
| 5.3.2    | <i>EEPROM MODE AT RESET</i> .....  | 45        |
| 5.3.3    | <i>EEPROM SPACE ADDRESS MAP</i> .....                                    | 46        |
| 5.4      | <b>SMBUS INTERFACE</b> .....   | 46        |
| 5.4.1    | <i>SMBUS BLOCK WRITE</i> .....   | 47        |
| 5.4.2    | <i>SMBUS BLOCK READ</i> .....  | 49        |
| 5.4.3    | <i>CSR READ, USING SMBUS BLOCK READ – BLOCK WRITE PROCESS CALL</i> ..... | 51        |
| 5.5      | <b>I2C INTERFACE</b> .....   | 51        |
| 5.5.1    | <i>I2C REGISTER WRITE ACCESS</i> .....                                   | 52        |
| 5.5.2    | <i>I2C REGISTER READ ACCESS</i> .....                                    | 54        |
| <b>6</b> | <b>HOT PLUG SUPPORT</b> .....  | <b>58</b> |
| 6.1      | <b>HOT PLUG TYPES</b> .....  | 58        |
| 6.1.1    | <i>SURPRISED SERIAL HOT PLUG</i> .....                                   | 58        |
| 6.1.2    | <i>SURPRISED PARALLEL HOT PLUG</i> .....                                 | 59        |
| 6.1.3    | <i>MANAGED SERIAL HOT PLUG</i> .....                                     | 59        |
| 6.2      | <b>TIMING SEQUENCE FOR SURPRISED HOT PLUG OPERATION</b> .....            | 60        |
| <b>7</b> | <b>CROSS-DOMAIN END-POINT</b> .....                                      | <b>62</b> |
| 7.1      | <b>GENERAL DESCRIPTION</b> .....   | 62        |
| 7.1.1    | <i>FAIL-OVER</i> .....   | 62        |
| 7.1.2    | <i>CO-PROCESSOR</i> .....  | 62        |
| 7.2      | <b>PORT CONFIGURATION</b> .....  | 63        |
| 7.3      | <b>BAR TRANSLATION FOR REMOTE HOST DOMAIN</b> .....                      | 63        |
| 7.3.1    | <i>DIRECT ADDRESS TRANSLATION (DAT)</i> .....                            | 64        |
| 7.3.2    | <i>ADDRESS LOOK-UP TRANSLATION (ALUT)</i> .....                          | 64        |
| 7.3.3    | <i>ID TRANSLATION</i> .....  | 64        |
| 7.4      | <b>BAR TRANSLATION FOR MAIN HOST DOMAIN</b> .....                        | 64        |
| 7.5      | <b>SCRATCHPADS AND DOORBELLS</b> .....                                   | 65        |
| <b>8</b> | <b>DIRECT MEMORY ACCESS</b> .....  | <b>66</b> |
| 8.1      | <b>GENERAL DESCRIPTION</b> .....   | 66        |
| 8.2      | <b>DMA CONFIGURATION</b> .....   | 66        |
| 8.2.1    | <b>DMA FUNCTIONS</b> .....   | 66        |
| 8.2.1.1  | <i>DMA MODE BIT DEFINITION</i> .....                                     | 67        |
| 8.2.1.2  | <i>DMA MODE AND CD MODE</i> .....  | 67        |
| 8.2.1.3  | <i>ENUMERATION</i> .....   | 67        |
| 8.2.2    | <b>DMA CONTROL REGISTER</b> .....  | 67        |
| 8.2.2.1  | <i>DMA DESCRIPTOR REGISTER</i> .....                                     | 68        |
| 8.2.2.2  | <i>DMA OPERATIONAL REGISTER</i> .....                                    | 68        |
| 8.3      | <b>DMA DESCRIPTORS AND TRANSFERS</b> .....                               | 69        |
| 8.3.1    | <b>DESCRIPTORS</b> .....   | 69        |
| 8.3.1.1  | <i>INITIALIZATION</i> .....  | 69        |
| 8.3.1.2  | <i>OWNERSHIP</i> .....   | 69        |
| 8.3.1.3  | <i>PRE-FETCH</i> .....   | 69        |

## 1 INTRODUCTION

The DIODES PI7C9X3G816GP is a PCIe<sup>®</sup> GEN3 packet switch that supports 16 lanes of GEN3 SERDES in flexible 2-port, 3-port, 4-port, 5-port and 8-port configurations. The architecture of the PCIe packet switch allows the flexible port configuration by allocating variable lane widths for each port. The packet switch can be configured to have different port types such as upstream port, downstream ports and Cross-Domain End-Point (CDEP) ports to support various applications, which include port fan-out, dual-host connectivity. Inside the packet switch, multiple DMA channels are embedded to facilitate data communication more efficiently among host(s) and end-points.

In addition, the PI7C9X3G816GP offers some extra benefits such as “maintaining high signal integrity in stress channel”, “advanced power management mechanism”, “enhanced reliability, availability and serviceability (RAS)” and “Surprised Hot Plug with LED Enclosure Management”.

*PCI Express<sup>®</sup> and PCIe<sup>®</sup> are trademarks or registered trademarks and/or service marks of PCI-SIG Corporation.*

## 1.1 KEY FEATURES

- Port and Lane Configurations for 8-port/16-Lane PCI Express GEN3 packet switch
  - Configurable Upstream lane widths of x1, x2, x4 or x8
  - Configurable Downstream port number up to 7
  - Configurable Downstream lane widths of x1, x2, x4 or x8
- Reference Clock Management
  - Integrated PCIe Gen3 clock buffer for all downstream ports
  - Support three reference clock structures (Common, SRNS and SRIS)
  - Handle SSC Isolation up to one port
  - Provide two clock application modes (Base and CDSR)
- Power Management
  - Support 7 power states (P0/P0s/P1/P1.1/P1.2/P2/P1.2PG)
  - Start-up power management scheme
    - “Empty” Hot-Plug ports put in P2 state
  - Support Message packet for System Power Management
    - Latency Tolerance Reporting (LTR)
    - Optimized Buffer Flush Fill (OBFF)
- PHY and MAC Layers
  - PHY initial settings optionally programmable through JTAG, EEPROM, and SMBus/I<sup>2</sup>C
  - Adaptive Continuous Time Linear Equalizer and 5-tap Decision Feedback Equalizer for RX
  - Adaptive and programmable 3-tap TX equalization
  - RX Polarity Inversion and Lane Reversal (Refer to 5.1.4)
- Data Link Layer
  - Programmable ACK latency timer to respond ACK based upon traffic condition
  - Configurable Flow Control Credit to balance bandwidth utilization and buffer usage
- Transaction Layer
  - Packet forwarding options including Cut-Through and Store & Forward
  - Support up to 512-Byte Max Payload Size
  - Low packet forwarding latency < 150ns (typical case)
  - Access Control Service (ACS) for peer-to-peer traffic
  - Address Translation (AT) packet for SR-IOV application
  - Support Atomic operation
  - Support Multicast
  - Provide Performance Visibility for ingress/egress packet types and packet counts
- Dual-Host Application
  - Support one Cross-Domain End-Point (CDEP) port for Host-to-Host Communications
  - Support Fail-over using CDEP port
  - Provide up to 4 physical or 8 virtual DMA channels enabling communications among Hosts and EPs
- Reliability, Availability and Serviceability
  - Enhanced Advanced Error Reporting
  - End-to-End Data Protection with ECC
  - Error Handling Mechanism
  - Support Surprise Hot Removal
  - Support Downstream Port Containment (DPC)
  - Support Hot Plug for Upstream and Downstream port
  - Provide Serial and Parallel Hot Plug Types
  - Support LED Management
  - Thermal Sensor reporting operational temperature instantly
  - IEEE 1149.1 and 1149.6 JTAG interface support
- Advanced Diagnostic Tools
  - PHY Eye<sup>™</sup>
  - MAC Viewer<sup>™</sup> (including embedded LA and LTSSM monitor)

- PCIBUDDY™
- On-the-fly PRBS loopback test
- On-the-fly Compliance pattern test
- Side-band Management Interface
  - I2C/SMBUS/JTAG
  - SPI EEPROM
- Standard Compliance
  - Compliant with PCI Express Base Specification Revision 3.1
  - Compliant with PCI Express CEM Specification Revision 3.0
  - Compliant with Advanced Configuration Power Interface (ACPI) Specification
  - Compliant with System Management (SM) Bus, Version 2.0
- Power & Package
  - Two power rails (0.95V and 1.8V)
  - Power consumption: 4.11W (full-loading at T<sub>j</sub>=80°C)
  - Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)
  - Halogen and Antimony Free. "Green" Device (Note 3)
  - An automotive-compliant part is available under separate datasheet (The DIODES™ [PI7C9X3G816GPQ](#))
  - Packages: 324-pin HFC 19mm x 19mm package

**Notes:**

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

## 2 GENERAL DESCRIPTION

Similar to the role of PCI/PCIX Bridge in PCI/PCIX bus architecture, the basic function of PCI Express (PCIe) Switch is to expand the connectivity to allow more end devices being reached by host controllers in terms of PCIe serial interconnect architecture. This 16-lane and 8-port PCIe Switch can extend the connections ranged from 2 to 7 PCIe devices by means of its flexible port and lane configurations. It provides users the variety to expand or fan-out the PCI Express lanes from one host based upon their application needs. On top of that, one port of the packet switch can be configured to connect with other host, so that the dual-host usage case can be realized.

In PCI Express system bus hierarchy, the packet switch can be visualized as a logical assembly of multiple virtual PCI-to-PCI Bridge (PPB), which represents either upstream or downstream port. Also, normally all of the primary buses of downstream ports and secondary bus of upstream port are shared with one common virtual PCI Bus. In terms of the port configuration setting in a single host environment, the packet switch PI7C9X3G816GP can be enumerated with one upstream-port PPB and up to 7 downstream-port PPBs.

The chip adopts a Multiple-Ring as switch core for reaching to each individual port. There are eight ports attached to the Multiple-Ring allowing upstream, downstream and peer-to-peer traffic exchanges simultaneously. Each port employs the structure of Combined Input and Output Queue (CIOQ) for buffer management. The main reason for choosing CIOQ is that the required memory bandwidth of input queue equals to the line rate of ingress port rather than increasing proportionally with port numbers as an output queue switch does. The CIOQ at each ingress port contains separate dedicated queues to store posted data, non-posted requests and completion packets. The packets are arbitrated to the egress port based upon the ID or address carried in packet header and PCIe transaction-ordering rule.

Packets can be forwarded in downstream, upstream or peer-to-peer direction concurrently. For the packets without ordering enforcement, they are permitted to pass over each other in cases where the addressed egress port is available to accept them. This can mitigate the issue of Head-Of-Line (HOL) blocking and also not affecting the operation of producer-consumer model, which is required to be retained to prevent from system hang-up problem. On the other hand, the replay buffer at each egress port (output queue) enhances data integrity by preserving the transmitted packets until the appropriate ACK is returned by the link partner. As the out-going packets can be stored in replay buffer, this can gain the maximum throughput and efficiency of the Switch. Another advantage of implementing CIOQ in PCIe Switch is that the credit announcement to the counterpart is simplified and streamlined in terms of the credit-based flow control protocol. The protocol requires that each ingress port maintains the credits independently without checking other ports' credit availability, which is otherwise required by pure output queue architecture.

The Switch supports several advanced features of latest PCI Express specification. They are respectively Access Control Service (ACS), Multi-Cast, Atomic Operation, Alternate Routing ID (ARI), Address Translation (AT) packet forwarding, Latency Tolerance Reporting (LTR) and Optimized Buffer Flush Fill (OBFF) etc. ACS allows the host system to have more control on peer-to-peer switch traffic. This can be a critical requirement in virtual machine system. Multi-Cast is an extended capability of PCIe switch to facilitate posted packets forwarded to a group of downstream ports efficiently. The switch is also capable of being a routing element for Atomic Operation commands, which has the advantages of synchronization among multiple processors or multiple-thread environment. When ARI capability is turned on, the ID routing has an alternative interpretation on Device and Function numbers. The Function number can be increased from 3 bits to 8 bits and no device number any more. This allows the downstream port of packet switch forwarding packets with up to 256 Functions. The LTR and OBFF are message-type packets for communicating between host and end-devices to achieve platform-wise power management. The switch needs to response these two messages for synchronizing the power states of each node in the PCIe interconnect architecture.

In addition to port fan-out function, the PI7C9X3G816GP can be configured to facilitate inter-processor communication between two Processors or between Processor and an intelligent adaptor configured in processor mode. As usual, the upstream port of packet switch is hooked up a host. When configuring one downstream port of the switch into CDEP mode, this port will be connected to another host rather than an endpoint. The packet switch then allows these two distinct hosts allocating their own PCIe bus and memory resources and makes the packet transfer happening between them by means of resource translation.

PI7C9X3G816GP supports embedded Direct Memory Access (DMA) capability to move data between two address locations that are set up via DMA channels. There are four physical DMA channels implemented in PI7C9X3G816GP and each physical channel can be shared by two virtual channels. So a total of eight DMA channels can be enabled in the packet switch to enable eight pairs of locations transferring data simultaneously. The DMA engine is configured and managed by a software driver running on the hosts connected to the upstream port or CD ports. In terms of the address locations and DMA ownership, the DMA engines can be used in a variety of applications such as device status collection, peer-to-peer host transfer and peer-to-peer end-point transfer etc.

### 3 PIN DESCRIPTION

#### 3.1 PCI EXPRESS INTERFACE SIGNALS

| NAME                         | PIN  | TYPE | DESCRIPTION  |
|------------------------------|--|------|--|
| REFCLKP[2:0]<br>REFCLKN[2:0] | M17,M14,G14<br>M16,M13,G15   | I    | <p><b>Reference Clock Input Pairs:</b> Connect to 100MHz differential clock source.</p> <p>Please refer to <a href="#">reference clock operational mode</a> for how to connect REFCLKP/N[2:0] to clock sources.</p> <p>The reference clock input is an unterminated AC coupled input. So the off-chip clock source must be terminated with both serial and parallel resistor network. Please refer to PCIe CEM specification for detail on how to realize on-board termination implementation.</p> |
| RESREF                       | N13  | I    | <p><b>Reference Resistor Connection:</b> Attach RESREF an external resistor with the precision of 200 ohm 1% 100-ppm/C to ground on the board. The reference resistor is used for calibration of RX and TX termination when the chip comes out of reset or a manual PHY tuning request is made.</p>  |
| PERP[15:0]                   | U16,U15,U14,U13,U12,U11,U10,U9,<br>B9,B10,B11,B12,B13,B14,B15,B16  | I    | <p><b>PCI Express Data Serial Input Pairs:</b> High-Speed Differential data receive signals.</p> <p>Please see the section of port/lane configuration.</p>   |
| PERN[15:0]                   | V16,V15,V14,V13,V12,V11,V10,V9,<br>A9,A10,A11,A12,A13,A14,A15,A16  |      |  |
| PETP[15:0]                   | P17,P16,P15,P14,P13,P12,P11,P10,<br>E9,E10,E11,E12,E13,E14,E15,E16 | O    | <p><b>PCI Express Data Serial Output Pairs:</b> High-Speed Differential data transmit signals.</p> <p>Please see the section of port/lane configuration.</p>   |
| PETN[15:0]                   | R17,R16,R15,R14,R13,R12,R11,R10,<br>D9,D10,D11,D12,D13,D14,D15,D16 |      |  |
| PERST_L                      | F18  | I    | <p><b>System Reset (Active LOW):</b> When PERST_L is asserted, the internal states of whole chip except sticky logics are initialized. This is a global reset to all operational modes of packet switch.</p> <p>This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K-ohm pull-up resistor be used.</p>            |

#### 3.2 CONFIGURATION STRAPPING SIGNALS

| NAME           | PIN              | TYPE | DESCRIPTION   |                |                  |    |        |    |            |    |         |    |             |
|----------------|------------------|------|---|----------------|------------------|----|--------|----|------------|----|---------|----|-------------|
| CHIPMODE[1:0]  | K15,K16          | I    | <p><b>Chip Operational Mode:</b> These two input signals decide at which operational mode the chip is chosen.</p> <table border="1"> <thead> <tr> <th>CHIP_MODE[1:0]</th> <th>Operational Mode</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>Normal</td> </tr> <tr> <td>01</td> <td>IDDQ/MBIST</td> </tr> <tr> <td>10</td> <td>AC JTAG</td> </tr> <tr> <td>11</td> <td>PHY Testing</td> </tr> </tbody> </table> <p>These pins have internal pull-down resistors. If no board trace is connected to these pins, the internal pull-down resistors of these pins are enough. However, if pins are connected to a board trace and not driven, it is recommended that external 330-ohm pull-down resistors be used.</p> | CHIP_MODE[1:0] | Operational Mode | 00 | Normal | 01 | IDDQ/MBIST | 10 | AC JTAG | 11 | PHY Testing |
| CHIP_MODE[1:0] | Operational Mode |      |   |                |                  |    |        |    |            |    |         |    |             |
| 00             | Normal           |      |   |                |                  |    |        |    |            |    |         |    |             |
| 01             | IDDQ/MBIST       |      |   |                |                  |    |        |    |            |    |         |    |             |
| 10             | AC JTAG          |      |   |                |                  |    |        |    |            |    |         |    |             |
| 11             | PHY Testing      |      |   |                |                  |    |        |    |            |    |         |    |             |
| PORTCFG[2:0]   | C7,C12,C15       | I    | <p><b>Port Configuration:</b> They are used to determine how 16 lanes are distributed among ports.</p> <p>Please refer to <a href="#">Port-Lane Configuration</a>.</p> <p>These strapping pins have no built-in internal resistors and can not be</p>   |                |                  |    |        |    |            |    |         |    |             |

| NAME            | PIN | TYPE | DESCRIPTION  |
|-----------------|-----|------|--|
|                 |     |      | left NC. These pins require the external 5.1K-ohm pull-up resistors or 330-ohm pull-down resistors.  |
| CKMODE          | F17 | I    | <p><b>Clock Operational Mode:</b> It is used define the relationship between physical SERDES lanes and reference clock.</p> <p>When CKMODE is 0, all 16 lanes (0 ~15) of SERDES are driven by one reference clock source.</p> <p>When CKMODE is 1, 16 lanes of SERDES are driven by two separate reference clock source via two pairs of reference clock inputs. Please refer to <a href="#">reference clock operational mode</a> for connection description.</p> <p>This pin has internal pull-down resistor. If no board trace is connected to these pins, the internal pull-down resistors of these pins are enough. However, if pin is connected to a board trace and not driven, it is recommended that external 330-ohm pull-down resistors be used.</p> |
| HOT_PLUG_EN_L   | *K7 | I    | <p><b>Hot Plug Function Enable:</b> It is used to determine the downstream port is capable of handling either managed or surprised hot plug events. Besides, the GPIO pins would be redefined for hot-plug function if HOT_PLUG_EN_L = 0.</p> <p>HOT_PLUG_EN_L and FATAL_ERR_L share the same pin.</p> <p>This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K- ohm pull-up resistor be used.</p>   |
| PHY_SRAM_BYPASS | *A2 | I    | <p><b>PHY SRAM Bypass:</b> When set, it will bypass PHY SRAM.</p> <p>PHY_SRAM_BYPASS and GPIO[30] share the same pin.</p> <p>This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K- ohm pull-up resistor be used.</p>  |
| SMBUS_EN_L      | U17 | I    | <p><b>System Manage Bus Enable:</b> This signal determines either SMBUS or I2C protocol being selected. When tied high, I2C protocol is selected. When tied low, SMBUS protocol is chosen.</p> <p>This pin has internal pull-up resistor. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K-ohm pull-up resistor be used.</p>   |
| PM_L11_EN_L     | *K6 | I    | <p><b>PM L1.1 Function Enable:</b> It is used to determine the downstream port is capable of PM L1.1 function. Besides, the GPIO[15:8] pins would be redefined for PM L1.1 function if PM_L11_EN_L = 0.</p> <p>PM_L11_EN_L and INTA_L share the same pin.</p> <p>This strapping pin has no built-in internal resistor and can not be left NC. This pin requires an external 5.1K-ohm pull-up resistor or 330-ohm pull-down resistor.</p>   |

### 3.3 HOT PLUG SIGNALS

| NAME      | PIN | TYPE | DESCRIPTION   |
|-----------|-----|------|---|
| SHCL_I2C  | M10 | OD   | <b>I2C Clock Signal of Serial Hot Plug Controller:</b> This signal SHCL_I2C is connected to SCL pin of I2C IO expander or CPLD. This pin requires external 5.1K-ohm pull-up resistor. |
| SHDA_I2C  | M11 | OD   | <b>I2C Data Signal of Serial Hot Plug Controller:</b> This signal SHDA_I2C is connected to SDA pin of I2C IO expander or CPLD. This pin requires external 5.1K-ohm pull-up resistor.  |
| SHPCINT_L | M12 | I    | <b>Interrupt Input (Active Low) of Serial Hot Plug Controller:</b> This   |

| NAME          | PIN                                     | TYPE | DESCRIPTION  |
|---------------|---|------|--|
|               |   |      | signal SHPCINT_L is connected to INT# output pin of I2C IO expander or CPLD. When asserted, it notifies Hot Plug Controller to access the port registers of I/O expander or CPLD for touching changed status to de-assert INT#.  |
| HP_LED[7:0]   | *T17,*E18,*D17,*D18,*C17,*C18,*B18,*A17 | O    | <b>Hot Plug LED:</b> These signals HP_LED[7:0] drive Amber LED state by following SFF-8489 IBPI specification.<br><br>HP_LED[7:0] and GPIO[7:0] share the same pins.   |
| HP_RST_L[7:0] | *K2,*K3,*K4,*K5,*K17,*M15,*L13,*L14     | O    | <b>Surprised Hot Plug Reset:</b> These signals HP_RST_L[7:0] drive reset signals to the hot plug slots. They can be controlled by either off-chip PERST_L when booting up system or internal hardware when device is hot plugged into the slot.<br><br>HP_RST_L[7:0] and GPIO[23:16] share the same pins.  |
| SURPRISE_HP   | *A1                                     | I    | <b>Disable Surprise Hot Plug Function:</b> This signal is used to enable surprise or managed hot function.<br><br>If SURPRISE_HP = 1, the operational type is “surprised”.<br>If SURPRISE_HP = 0, the operational type is “managed”.<br><br>SURPRISE_HP and GPIO[31] share the same pin.<br><br>This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K- ohm pull-up resistor be used. |

### 3.4 REFERENCE CLOCK OUTPUT AND CONTROL SIGNALS

| NAME                 | PIN                                     | TYPE | DESCRIPTION   |
|----------------------|---|------|---|
| REFCLKOP[7:0]        | G5,G6,G7,G8,D6,D7,D8,A7                 | O    | <b>Integrated Reference Clock Output Pairs:</b> 100MHz external differential HCSL clock outputs from integrated reference clock buffer.   |
| REFCLKON[7:0]        | H5,H6,H7,G9,E6,E7,E8,B7                 |      |   |
| REFCLKIP<br>REFCLKIN | A8<br>B8                                | I    | <b>Integrated Reference Clock Input Pair:</b> Connect to external 100MHz differential clocks for the integrated reference clock buffer.<br><br>This differential reference clock input pair can be left as unconnected if the integrated reference clock buffer is not used.  |
| CKBUFPD_L            | *D1                                     | I    | <b>Integrated Reference Clock Buffer Power Down Signal:</b> This signal CKBUFPD_L is used to shut down the integrated clock buffer. When CKBUFPD_L is asserted low, the integrated reference clock buffer and reference clock outputs are disabled.<br><br>CKBUFPD_L and GPIO[26] share the same pin.<br><br>This pin has internal pull-up. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K- ohm pull-up resistor be used.   |
| CLKREQ_L[7:0]        | *L15,*L17,*L18,*M18,*N18,*P18,*R18,*T18 | OD   | <b>Reference Clock Request Signals:</b> These signals CLKREQ_L[7:0] are used to request reference clock for active operation. Each port (i.e. 0..7) has its own clock request signal. When asserted, the reference clock is on for both ends of the link. When deasserted, the reference clock is off and both ends of the link are put under L1 sub-state of power management.<br><br>CLKREQ_L[7:0] and GPIO[15:8] share the same pins.<br><br>CLKREQ_L[7:0] pins have internal pull-up. If no board trace is connected to these pins, the internal pull-up resistors of these pins are enough. However, if pins are connected to a board trace and not driven, it is recommended that external 5.1K- ohm pull-up resistors be used. |
| CLKBUF_CMOS          | L16                                     | I    | <b>Clock Buffer Input Select:</b> It is used to select the input of integrated  |

| NAME  | PIN | TYPE | DESCRIPTION  |
|-------|-----|------|--|
| _EN_L |     |      | ref clock buffer. When set high, the input is came the external reference clock surce through REFCLKIP/N pin. When set low, the input is came from internal PHY clock and REFCLKIP/N pin need be tied to GND through 330-ohm resistor. |

### 3.5 SIDE BAND MANAGEMENT SIGNALS

| NAME          | PIN         | TYPE | DESCRIPTION  |
|---------------|-------------|------|--|
| EECK          | H16         | I/O  | <b>EEPROM Clock:</b> Clock signal to 4-wire EEPROM interface.<br><br><b>Debug Mode Enable (Debug_Mode_EN_L):</b> During system initialization, EECK acts as the Debug_Mode_EN_L pin. In debug mode, it need be tired to low through a 330-ohm pull-down resistor. This pin has internal pull-up resistor. If no board trace is connected to this pin, the internal pull-up resistor of this pin is enough. However, if pin is connected to a board trace and not driven, it is recommended that an external 5.1K-ohm pull-up resistor be used. |
| EEDI          | J16         | O    | <b>EEPROM Data Input:</b> The switch outputs data to the Data Input pin of Serial EEPROM.  |
| EEDO          | H18         | I    | <b>EEPROM Data Output:</b> The switch inputs data from the Data Output pin of Serial EEPROM.   |
| EECS_L        | H17         | O    | <b>EEPROM Chip Select (Active Low):</b> The switch asserts this signal to enable Serial EEPROM.  |
| SCL_I2C       | K18         | OD   | <b>SMBUS/I2C Serial Clock:</b> System management or I2C Bus Clock. This pin requires an external 5.1K-ohm pull-up resistor.  |
| SDA_I2C       | J18         | OD   | <b>SMBUS/I2C Serial Data:</b> Bi-Directional System Management or I2C Bus Data. This pin requires an external 5.1K-ohm pull-up resistor.   |
| I2C_ADDR[2:0] | V17,V18,U18 | I    | <b>SMBUS/I2C Slave Address Bit [2:0]:</b> These pins are used to configure the value of the three least significant bits of the switch 7-bit Slave address. These pins require the external 5.1K-ohm pull-up resistors or 330-ohm pull-down resistors.   |

### 3.6 MISCELLANEOUS CONTROL AND STATUS

| NAME        | PIN   | TYPE | DESCRIPTION  |
|-------------|---|------|--|
| PDC_L[7:0]  | N9,P8,P9,R8,R9,T8,U8,V8   | I    | <b>Present Detect:</b> When PDC_L is asserted low, it indicates this port is present. Otherwise, it indicates this port is absent.<br><br>These pins have internal pull-up. If no board trace is connected to these pins, the internal pull-up resistors of these pin are enough. However, if pins are connected to a board trace and not driven, it is recommended that external 5.1K- ohm pull-up resistors be used. |
| GPIO[31:0]  | A1,A2,B1,B2,C1,D1,E1,F1,K2,K3,K4,K5,K17,M15,L13,L14,L15,L17,L18,M18,N18,P18,R18,T18,T17,E18,D17,D18,C17,C18,B18,A17 | I/O  | <b>General Purpose Input and Output:</b> These thirty-two general-purpose pins are programmed as either input-only or bi-directional pins by writing the GPIO output enable control register.  |
| FATAL_ERR_L | K7  | O    | <b>Fatal Error Output:</b> It is asserted low when a Fatal error is detected.  |
| INTA_L      | K6  | OD   | <b>Interrupt Output Enable:</b> When driven low, it indicates that one or more of the following events/errors are detected: Hot Plug events, Link State events, General-Purpose Input Interrupt events, Device-Specific errors, Device-Specific CDEP Port Link Interface errors and events, CDEP-Virtual Doorbell events or CDEP-Link Doorbell events.   |
| LNKSTS[7:0] | H15,H14,H13,H12,G13,G16,G17,G18   | O    | <b>Port Good Status:</b> These signals indicate the link status of each port.<br><br>OFF – Link is down<br>Blinking, 512 ms ON, 512 ms OFF (1Hz) – Link Up at 2.5 GT/s<br>Blinking, 256 ms ON, 256 ms OFF (2Hz) – Link Up at 5.0GT/s<br>ON – Link Up at 8.0GT/s  |

| NAME | PIN   | TYPE | DESCRIPTION  |
|------|---|------|--|
|      |   |      | PORTGOOD_L[x] is correspondent to Port x, where y=0...7.                             |
| TEST | C4  | I    | <b>Test:</b> This pin should be tied to ground through a 330-ohm pull-down resistor. |
| NC   | A3,A4,A5,A6,B3,B4,B5,B6,D2,D3,D4,D5,E2,E3,E4,E5,F6,G1,G2,G3,G4,H1,H3,H4,J1,J2,J3,J6,J7,L1,L2,L3,L4,L5,L6,L7,K1,M1,M3,M4,M5,M6,M7,M8,N1,N2,N3,P1,P2,P4,P5,P6,P7,R1,R2,R3,R4,R5,R6,R7,T1,T2,T4,U1,U3,U4,U5,U6,U7,V1,V2,V3,V4,V5,V6,V7 |      | <b>Not Connected:</b> These pins can be just left open.                              |

### 3.7 JTAG BOUNDARY SCAN SIGNALS

| NAME       | PIN | TYPE | DESCRIPTION   |
|------------|-----|------|---|
| TCK        | K13 | I    | <b>Test Clock:</b> Used to clock state information and data into and out of the chip during switch's boundary scan or PCIe PHY's internal registers access. When JTAG function is not implemented, this pin should be left open (NC). |
| TDI        | J14 | I    | <b>Test Data Input:</b> Used (in conjunction with TCK) to shift data and instructions into the TAP in a serial bit stream. When JTAG function is not implemented, this pin should be left open (NC).                                  |
| TDO        | J15 | O    | <b>Test Data Output:</b> Used (in conjunction with TCK) to shift data out of the Test Access Port (TAP) in a serial bit stream. When JTAG function is not implemented, this pin should be left open (NC).                             |
| TMS        | J13 | I    | <b>Test Mode Select:</b> Used to control the state of the Test Access Port controller. When JTAG function is not implemented, this pin should be pulled low through a 330-Ohm pull-down resistor.                                     |
| TRST_L     | J12 | I    | <b>Test Reset (Active LOW):</b> Active LOW signal to reset the TAP controller into an initialized state. When JTAG function is not implemented, this pin should be pulled low through a 330-Ohm pull-down resistor.                   |
| JTAG_SEL_L | A18 | I    | <b>JTAG Selection (Active LOW):</b> When set high, JTAG pins used for controlling switch's boundary scan, when set low, JTAG pins used for accessing PCIe PHY internal registers.   |

### 3.8 POWER PINS

| NAME   | PIN   | TYPE | DESCRIPTION   |
|--------|---|------|---|
| VDDC   | H9,H11,J8,J10,K9,K11,L8,L10,L12   | P    | <b>VDDC Supply (0.95V):</b> Used as digital core power pins.                  |
| C_VDDC | F7  | P    | <b>VDDC Supply (0.95V):</b> Used as reference clock power pins.               |

## 4 FUNCTIONAL OVERVIEW

This chapter provides an overview of the PI7C9X3G816GP's major functions.

### 4.1 MODES OF OPERATIONS

The PI7C9X3G816GP supports two modes of operations.

- Base Mode (Fan-out Mode)
- Cross-Domain End-Point (CDEP Mode)

#### 4.1.1 BASE MODE (FAN-OUT MODE)

The Base mode is one of the Fan-out mode types. In this mode, the PI7C9X3G816GP supports one upstream port and up to 7 down ports. Multiple virtual PCI-to-PCI bridges are connected by a virtual PCI bus, residing in the Switch.

**Figure 4-1 Base Mode (Fan-out Mode) Overview**

#### 4.1.2 Cross-Domain End-Point Mode

The switch supports a Cross-Domain End-Point (CDEP) mode allowing more than one host attached to PI7C9X3G816GP. When configured as CDEP mode, one of downstream port will be turned into CDEP port for additional host to connect with it. So the packets produced from different hosts can exchange through PI7C9X3G816GP for [system failover application](#).

**Figure 4-2 Cross-Domain End-Point Mode Overview**

## 4.2 PHYSICAL LAYER CIRCUITS

The physical layer circuit design is defined as a converter between serial bus interface and the PHY Interface for PCI Express Architecture (PIPE). It contains Physical Media Attachment (PMA) and Physical Coding Sub-layer (PCS) blocks. PMA includes Serializer/ Deserializer (SERDES), PLL1, Adaptive TX and RX Equalization, Clock Recovery module, receiver detection circuit, electrical idle detector, and input/output buffers. PCS consists of two blocks for handling 128B/130B and 8B/10B encoder/decoder, SYNC code-word framer, receiver elastic buffer, and PIPE PHY control/status circuitries. To provide the flexibility for bifurcating multiple lanes into different port width of configuration, the control and status signals of each lane can be combined for MAC to access as a link basis. In addition, a pair of PRBS generator and checker is included for PHY built-in self-test. The main functions of physical layer circuits include the conversion between serial-link and parallel bus, provision of clock source for the Switch, resolving clock difference in receiver end, and detection of physical layer errors.

The driver characteristics including amplitude, and pre-emphasis, on transmit (TX) side are programmable. The PHY on receive (RX) side is capable of automatic calibration and configuration of the internal circuits to maximize receiving performance. In addition, the PHY provides the flexibility for user to override or disable the automatically calibrated settings.

Definition of the Switch Downstream Port’s Transmitter presets can be set by LANE EQUALIZATION CONTROL REGISTER (OFFSET from 21Ch – 238h). The encoding for the Transmitter presets is provided in Table 4-1. The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost.

**Table 4-1 Transmitter Preset Encoding**

| Encoding    | De-emphasis (dB) | Preshoot (dB) |
|-------------|------------------|---------------|
| 0000b       | -6.02            | 0.00          |

### 4.2.1 PHY CONTROL REGISTER PARALLEL INTERFACE ACCESS

PI7C9X3G816GP provides the flexibility for user to adjust the transmit swing through the Control Register (CR) Parallel register interface by PCIe link, EEPROM, SMBUS or I2C individually.

The PHY Control Register (CR) Parallel interface is a synchronous, 16 bit data/address parallel port provided for on-chip access to control registers inside the PHY. While access to these registers is not required for normal PHY operation, this interface is included for users that want to override some of the PHY’s control signals.

The CR registers can be accessed through PCIe Configuration Registers. The user may access [CR RW CTRL and STATUS](#) register in PCIe Configuration Register space to access the PHY Control Register.

The PI7C9X3G816GP is constructed of two tiles. Each of the two tiles is constructed of four PCIe PHYs to support 16 lanes. Each title appears as a separate PCIe bridge device in the system with a single upstream port and multiple downstream port. The Tile ID can be located in [Operation Mode](#) register (Offset 348h[2:0]).

<sup>1</sup> Multiple lanes could share the PLL.

All PHY Registers of a given lane in any PHY can be configured through CR Parallel interface via PCI Configuration Registers in upstream port (Port 0): [CR RW CTRL AND STATUS](#) register (Port 0, Offset 5C0h), [CR CTRL 0](#) register (Port 0, Offset 5C4h), [CR CTRL 1](#) register (Port 0, Offset 5C8h), [CR CTRL 2](#) register (Port 0, Offset 5CCh) and [CR CTRL 3](#) register (Port 0, Offset 5D0h). The port is an upstream port when the Port Number field is 0 ([Link Capability](#) register, Offset 74h[31:24]),

The PHY Control Registers of any one of the 16 lanes can be accessed through the CR CTRL register defined in the table below. A specific lane can be located by enumerating the PHY Number from 0 to 3, and the N Value from 0 to 3.

**Table 4-2 PCIe Configuration Registers Used to Access PHY CR Registers**

| Lane    | PHY Number | N Value | PCIe Configuration Register Used to Access PHY CR Register                  |
|---------|------------|---------|---|
| Lane 0  | 0          | 0       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 0</a> registers |
| Lane 1  | 0          | 1       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 0</a> registers |
| Lane 2  | 0          | 2       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 0</a> registers |
| Lane 3  | 0          | 3       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 0</a> registers |
| Lane 4  | 1          | 0       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 1</a> registers |
| Lane 5  | 1          | 1       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 1</a> registers |
| Lane 6  | 1          | 2       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 1</a> registers |
| Lane 7  | 1          | 3       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 1</a> registers |
| Lane 8  | 2          | 0       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 2</a> registers |
| Lane 9  | 2          | 1       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 2</a> registers |
| Lane 10 | 2          | 2       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 2</a> registers |
| Lane 11 | 2          | 3       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 2</a> registers |
| Lane 12 | 3          | 0       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 3</a> registers |
| Lane 13 | 3          | 1       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 3</a> registers |
| Lane 14 | 3          | 2       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 3</a> registers |
| Lane 15 | 3          | 3       | <a href="#">CR RW CTRL and STATUS</a> / <a href="#">CR CTRL 3</a> registers |

The packet switch provides CFG registers (offset [5C0h](#), [5C4h](#), [5C8h](#), [5CCh](#) and [5D0h](#)) to access Qual PHY registers.

#### 4.2.1.1 Read Procedures

- (1) Read PHY0~PHY3 CR Status by CFG Offset [5C0h](#)

Bit[19]=1, PHY3 CR READY To RW  
 Bit[18]=1, PHY2 CR READY To RW  
 Bit[17]=1, PHY1 CR READY To RW  
 Bit[16]=1, PHY0 CR READY To RW

- (2) Write PHY0~PHY3 CR Address by CFG OFFSET [5C4h](#), [5C8h](#), [5CCh](#) and [5D0h](#)

Bit[31:16], PHY Register Address

- (3) Write PHY0 ~PHY3 CR Read Enable bit by CFG OFFSET [5C0h](#)

Bit[11]=1, Enable PHY3 CR Read  
 Bit[10]=1, Enable PHY2 CR Read  
 Bit[9]=1, Enable PHY1 CR Read  
 Bit[8]=1, Enable PHY0 CR Read

- (4) Read PHY0 ~PHY3 CR Read Data by CFG OFFSET [5C4h](#), [5C8h](#), [5CCh](#) and [5D0h](#)

Bit[15:0], PHY Register Data

#### 4.2.1.2 Write Procedures

- (1) Check PHY0 ~PHY3 CR STATUS by CFG OFFSET [5C0h](#)

Bit[19]=1, PHY3 CR READY To RW  
Bit[18]=1, PHY2 CR READY To RW  
Bit[17]=1, PHY1 CR READY To RW  
Bit[16]=1, PHY0 CR READY To RW

- (2) Write PHY0~PHY3 CR Address and Data by CFG OFFSET [5C4h](#), [5C8h](#), [5CCh](#) and [5D0h](#)

Bit[31:16], PHY Register Address  
Bit[15:0], PHY Register Data

- (3) Enable PHY0 ~PHY3 CR Write Enable bit by CFG OFFSET [5C0h](#)

Bit[3]=1, Enable PHY3 CR Write  
Bit[2]=1, Enable PHY2 CR Write  
Bit[1]=1, Enable PHY1 CR Write  
Bit[0]=1, Enable PHY0 CR Write

### 4.3 MEDIA ACCESS CONTROL (MAC)

The Media Access Control (MAC) block, which is consisted of physical layer packet boundary delineation and formation, multiple lanes de-skew, scrambler/de-scrambler, clock correction from inserting skip order-set, PIPE-related control/status circuits and Link Training Status State Machine (LTSSM), is implemented to interface physical layer with data link layer, build and maintain the link between two link partners.

The switch allows users to control GEN3 Link EQ parameters and link training behavior such as detection, compliance and lane reverse etc. The switch implements a group of LTSSM CSR registers located at offset starting from 380h to 3A0h to configure LTSSM operation.

### 4.4 DATA LINK LAYER (DLL)

The Data Link Layer (DLL) provides a reliable data transmission between two PCI Express points. An ACK/NACK protocol is employed to guarantee the integrity of the packets delivered. Each Transaction Layer Packet (TLP) is protected by a 32-bit LCRC for error detection. The DLL receiver performs LCRC calculation to determine if the incoming packet is corrupted in the serial link. If an LCRC error is found, the DLL transmitter would issue a NACK data link layer packet (DLLP) to the opposite end to request a re-transmission, otherwise an ACK DLLP would be sent out to acknowledge on reception of a good TLP.

The moment for issuing ACK DLLP is dependent on a time-out event of ACK latency timer or transmitter channel availability. According to PCI Express specification, the calculation of ACK latency timer is based upon maximum payload size, link width, TLP overhead, ACK factor and internal processing delay. The calculated values are determined by hardware as a default to meet PCIe specified requirement. On the other hand, the chip provides a flexibility to change the value of ACK latency timer by programming the bit 11 ~ bit 0 of DLL CSR registers at offset [420/424/428H](#) for G1/G2/G3 speed. The programmable ACK latency timer can regulate the frequency of issuing ACK DLLP. This can facilitate performance tuning under a burst of TLP in transmission.

In the transmitter, a retry buffer is implemented to store the transmitted TLPs whose corresponding ACK/NACK DLLP have not been received yet. When an ACK is received, the TLPs with sequence number equals to and smaller than that carried in the ACK would be flushed out from the buffer. If a NACK is received or no ACK/NACK is returned from the link partner after the replay timer expires, then a replay mechanism built in DLL transmitter is triggered to re-transmit the corresponding packet that receives NACK or time-out and any other TLP transmitted after that packet.

Meanwhile, the DLL is also responsible for the initialization, updating, and monitoring of the flow-control credit. All of the flow control information is carried in DLLP that is sent to the other end of link. Unlike TLP, DLLP is guarded by 16-bit CRC to detect if data corruption occurs. Furthermore, DLLP is used to handshake protocol between link parties for entering different power states such as PM L1 etc.

The chip implements a group of DLL CSR registers started from offset [420h](#) to [46Ch](#) for users to control the Flow control packet behavior, DLL packet error status report, replay timer and ACK latency timer etc.

## 4.5 TRANSACTION LAYER RECEIVE BLOCK (TLP DECAPSULATION)

The receiving portion of the transaction layer performs header information retrieval and validates the correctness of the transaction type and format. If the TLP is found to contain an illegal header or the indicated packet length mismatches with the actual packet length, then a Malformed TLP is reported as an error associated with the receiving port. PCIe also supports End-to-End CRC operation to ensure end-to-end data integrity, a 32-bit ECRC is checked against the TLP at the receiver if the digest bit is set in header. Please note for ECRC operation, it is necessary both of EP and RC to support ECRC as well.

## 4.6 ROUTING

The transaction layer implements three types of routing protocols: ID-based, address-based, and implicit routing. For configuration reads, configuration writes, transaction completion, and user-defined messages, the packets are routed by their destination ID constituted of bus number, device number, and function number. Address routing is employed to forward I/O or memory transactions to the destination port, which is located within the address range indicated by the address field carried in the packet header. The packet header indicates the packet types including memory read, memory write, IO read, IO write, Message Signaling Interrupt (MSI) and user-defined message. Implicit routing is mainly used to forward system message transactions such as virtual interrupt line, power management, and so on. The message type embedded in the packet header determines the routing mechanism.

If the incoming packet cannot be forwarded to any other port due to a miss to hit the desired address range or targeted ID, this is considered as Unsupported Request (UR) packet, which is similar to a master abort event in PCI protocol.

In addition to following standard packet routing rule, the chip also implements a group of TL CSR registers started from offset [4C0h](#) to [4C8h](#) for users to control packet forwarding mode, packet ordering and arbitration scheme etc.

## 4.7 QUEUE

Six TLP packet types are defined in PCI Express architecture: Memory read/write, IO read/write, Config read/write, Completions, Messages, and Atomic. Each of these packet types fits into the separate switch queues: Posted Request Header (PH), Posted Request Data payload (PD), Non-Posted Request Header (NPH), Non-Posted Data Payload (NPD), Completion Header (CPLH) and Completion Data payload (CPLD). Each packet with different type would be put into a separate queue in order to facilitate the following ordering processor. NPD only contains one DW for all Non-post requests except CAS AtomicOP with 128-bit operand size, which requires two DWs, so it can be merged with the corresponding NPH into a common queue named NPHD.

### 4.7.1 POSTED REQUEST HEADER (PH)

PH queue provides TLP header spaces for posted memory writes and various message request headers. The types of TLP stored in this queue are MWr, Msg and MsgD. Each header space occupies sixteen bytes to accommodate 3 DW or 4 DW headers. The number of entries in PH range from 8 to 16 depending on the lane width of link.

### 4.7.2 POST REQUEST DATA (PD)

PD queue is used for storing posted request data. If the received TLP is a posted request type such as MWr or MsgD, and contained payload other than the header, the payload data would be put into PD queue. The size of PD queue ranges from 2KB to 4KB depending on the lane width of link.

### 4.7.3 NON-POSTED REQUEST HEADER AND DATA (NPHD)

NPHD queue provides TLP header spaces for non-posted request packets, which include memory read, IO read, IO write, configuration read, configuration write and AtomicOP requests. The types of TLP stored in this queue are MRd, MRdLk, IORd, IOWr, CfgRd0/CfgRd1, CfgWr0/CfgWr1, FetchAdd, Swap and CAS. Usually only IO or configuration write and Atomic requests are given additional data credit. The other TLP type is just given header credit. Each header space takes twenty-four bytes to accommodate the following combinations: 3-DW header, 4-DW header, 3-WD header with 1-DW data, 3-WD header with 2-DW data, 4-DW header with 1-DW data and 4-DW header with 2-DW data. In total, the number of entries in NPHD range from 8 to 16 depending on the lane width of link.

### 4.7.4 COMPLETION HEADER (CPLH)

CPLH queue provides TLP header space for completion packets. The types of TLP stored in this queue are Cpl, CplD, CplLk and CplDLk. Each header space takes twelve bytes to accommodate a 3-DW header. Please note that there are no 4-DW completion headers. The number of entries in CPLH range from 8 to 16 depending on the lane width of link.

### 4.7.5 COMPLETION DATA (CPLD)

CPLD queue is used for storing completion data. If the received TLP is a CplD or CplDLk type and contained payload other than the header, the payload data would be put into CPLD queue. The size of CPLD queues range from 2KB to 4KB depending on the lane width of link.

## 4.8 TRANSACTION ORDERING

A set of ordering rules is defined to regulate the transactions on the PCI Express Switch including Memory, IO, Configuration and Messages, in order to avoid deadlocks and to support the Producer-Consumer model. The ordering rules defined in Table 4-2 apply within a single Traffic Class (TC). There is no ordering requirement among transactions within different TC labels. Since the transactions with the same TC label are not allowed to map into different virtual channels, it implies no ordering relationship between the traffic in VC0.

**Table 4-3 Summary of PCI Express Ordering Rules**

| Row Pass Column             | Posted Request      | Read Request     | Non-posted Write Request | Read Completion  | Non-posted Write Completion |
|-----------------------------|---------------------|------------------|--------------------------|------------------|-----------------------------|
| Posted Request              | Yes/No <sup>1</sup> | Yes <sup>5</sup> | Yes <sup>5</sup>         | Yes <sup>5</sup> | Yes <sup>5</sup>            |
| Read Request                | No <sup>2</sup>     | Yes              | Yes                      | Yes              | Yes                         |
| Non-posted Write Request    | No <sup>2</sup>     | Yes              | Yes                      | Yes              | Yes                         |
| Read Completion             | Yes/No <sup>3</sup> | Yes              | Yes                      | Yes              | Yes                         |
| Non-Posted Write Completion | Yes <sup>4</sup>    | Yes              | Yes                      | Yes              | Yes                         |

1. When the Relaxed Ordering Attribute bit is cleared, the Posted Request transactions including memory write and

message request must complete on the egress bus in the order in which they are received on the ingress bus. If the Relaxed Ordering Attribute bit is set, the Posted Request is permitted to pass over other Posted Requests occurring before it.

2. A Read Request transmitting in the same direction as a previously queued Posted Request transaction must push the posted write data ahead of it. The Posted Request transaction must complete on the egress bus before the Read Request can be attempted on the egress bus. The Read transaction can go to the same location as the Posted data. Posted read requests are not allowed to pass posted write transactions due to the concern that if the read and write are to the same location, the subsequent data returned from the read request would be stale data.
3. When the Relaxed Ordering Attribute bit is cleared, a Read completion must “pull” ahead of previously queued posted data transmitting in the same direction. In this case, the read data transmits in the same direction as the posted data, and the requestor of the read transaction is on the same side as the completer of the posted transaction. The posted transaction must deliver to the completer before the read data is returned to the requestor. If the Relaxed Ordering Attribute bit is set, then a read completion is permitted to pass a previously queued Memory Write or Message Request.
4. Non-Posted Write Completions are permitted to pass a previous Memory Write or Message Request transaction. Such transactions are actually transmitting in the opposite directions and hence have no ordering relationship.
5. Posted Request transactions must be given opportunities to pass Non-posted Read and Write Requests as well as Completions. Otherwise, deadlocks may occur when some older bridges, which do not support delayed transactions are mixed with PCIe Switch in the same system. A fairness algorithm is used to arbitrate between the Posted Write queue and the Non-posted transaction queue

## 4.9 PORT ARBITRATION

Among multiple ingress ports, the port arbitration built in the egress port determines which incoming packets to be forwarded to the output port. Switch support hardware fixed Round Robin arbitration algorithm. The port arbitration is held within the Virtual Channel 0. At the upstream ports, in addition to the inter-port packets, the intra-port packet such as configurations completion would also join the arbitration loop to get the service from Virtual Channel 0.

### 4.10 FLOW CONTROL

PCI Express employs Credit-Based Flow Control mechanism to make buffer utilization more efficient. The transaction layer transmitter ensures that it does not transmit a TLP to an opposite receiver unless the receiver has enough buffer space to accept the TLP. The transaction layer receiver has the responsibility to advertise the free buffer space to an opposite transmitter to avoid packet stale. In this Switch, each port has its own separate queues for different traffic types (Posted, Non Posted and Completion) and the credits of each type are continually updated via the data link layer on the fly. The data link layer compares the current available credits with the monitored ones and reports the updated credit to the counterpart. If no new credit is acquired, the credit reported is scheduled for every 30 us to prevent the link from entering retrain. On the other hand, the receiver at each egress port gets the usable credits from the opposite end in a link. The egress port notifies the usable credit information to all ingress ports to receive packets that are intended to that egress port.

## 4.11 TRANSACTION LAYER TRANSMIT BLOCK (TLP ENCAPSULATION)

The transmit portion of transaction layer performs the following functions. They construct the all types of forwarded TLP generated from VC arbiter, respond with the completion packets when the local resource (i.e. configuration register) is accessed, and regenerate the message that terminates at receiver to RC if acting as an upstream port.

## 4.12 ACCESS CONTROL SERVICE (ACS)

Traditionally, the packet routing between the peer-to-peer downstream ports is determined by either the address or ID field embedded in the packet header. Access Control Service (ACS) provides a mechanism for customer to selectively control access between PCI Express Endpoints attached to the downstream ports of packet switch. If ACS is enabled in the ingress port, the peer-to-peer packet forwarding will follow the rule sets of ACS rather than the destination ID or address. ACS is implemented as a set of capabilities and control registers in the associated hardware component. It brings the following benefits such as preventing the silent data corruption presented in Requests from being incorrectly routed to a peer Endpoint, validating every Request transaction between two downstream components and enabling direct routing of peer-to-peer Memory Requests whose addresses have been translated when ATS system is being used. ACS is usually enabled for directing all peer-to-peer traffic between downstream ports to upstream port.

Please refer to [ACS Extended Capability](#) registers at offset 1C0h for more information.

## 4.13 MULTICAST OPERATION

This is a PCIe optional feature allowing posted packets delivered to multiple endpoints with an efficient way. For some application, more than one target would receive the same packet. By using traditional unicast operation, this packet would be repeatedly transmitted until all targets receive the same packet. The multicast operation would only require one-time transmission to serve all targets. The PCIe spec defines a Multicast Capability structure containing a Multicast address range that is dividable into multiple Multicast Group (MCG) with the size of Multicast Window to enable multicast operation. The multicast address range must be in the same host domain. Multicast is not translated into other host domain address location for cross-domain multicast transactions.

When the incoming packet hits the dedicated MCG within the Multicast address range defined in the ingress port, it will be simultaneously forwarded to the selected egress ports, which have the corresponding MCG bit set in MC\_Receive register, if no blocking happens in ingress port. The ingress port also allows the multicast-hit packet being dropped by enabling the corresponding MCG bit in MC\_Block\_All or MC\_Block\_Untranslated register.

Please refer to [Multicast Extended Capability](#) registers at offset 1D0h for more information.

## 5 CHIP INITIALIZATION

### 5.1 PORT-LANE CONFIGURATION

#### 5.1.1 MODE SELECTION

PI7C9X3G816GP can be configured into 2 Ports, 3 Ports, 4 Ports, 5 Ports, and 8 Ports across 16 Lanes by employing [PORTCFG\[2:0\]](#) pins.

**Table 5-1 Mode Selection**

| PORTCFG[2] | PORTCFG[1] | PORTCFG[0] | Functional Mode                            |
|------------|------------|------------|--|
| 0          | 0          | 1          | 2Port-16Lane Configuration                 |
| 0          | 1          | 0          | 3Port-16Lane Configuration                 |
| 0          | 1          | 1          | 4Port-16Lane Configuration <sup>Note</sup> |
| 1          | 0          | 0          | 5Port-16Lane Configuration                 |
| 1          | 0          | 1          | 8Port-16Lane Configuration                 |

Note: When PORTCFG\_x[2:0] set to 011b (416 mode), it can support bifurcation. Based on “Fix\_416\_result” register setting, switch can be configured to 4Port-16Lane, 5Port-16Lane, 6Port-16Lane, 7Port-16Lane and 8Port-16Lane configurations. See [offset 55Ch](#) for more detail.

#### 5.1.2 LANE MAPPING

The table below shows the mapping of the lanes to the transmission and receive pairs.

**Table 5-2 Lane Mapping**

| Lane    | TX Pair          | RX Pair          |
|---------|------------------|------------------|
| Lane 0  | PETP[0]PETN[0]   | PERP[0]PERN[0]   |
| Lane 1  | PETP[1]PETN[1]   | PERP[1]PERN[1]   |
| Lane 2  | PETP[2]PETN[2]   | PERP[2]PERN[2]   |
| Lane 3  | PETP[3]PETN[3]   | PERP[3]PERN[3]   |
| Lane 4  | PETP[4]PETN[4]   | PERP[4]PERN[4]   |
| Lane 5  | PETP[5]PETN[5]   | PERP[5]PERN[5]   |
| Lane 6  | PETP[6]PETN[6]   | PERP[6]PERN[6]   |
| Lane 7  | PETP[7]PETN[7]   | PERP[7]PERN[7]   |
| Lane 8  | PETP[8]PETN[8]   | PERP[8]PERN[8]   |
| Lane 9  | PETP[9]PETN[8]   | PERP[9]PERN[9]   |
| Lane 10 | PETP[10]PETN[10] | PERP[10]PERN[10] |
| Lane 11 | PETP[11]PETN[11] | PERP[11]PERN[11] |
| Lane 12 | PETP[12]PETN[12] | PERP[12]PERN[12] |
| Lane 13 | PETP[13]PETN[13] | PERP[13]PERN[13] |
| Lane 14 | PETP[14]PETN[14] | PERP[14]PERN[14] |
| Lane 15 | PETP[15]PETN[15] | PERP[15]PERN[15] |

#### 5.1.3 PORT NUMERING

The port number is given in the port number field of link capability register. Each port has different link width capability, which is also defined in Maximum Link Width field of this capability register. Following table is the port number in the switch and the corresponding maximum link width.

**Table 5-3 Port Numbering**

| Port Number | P0 | P1 | P2 | P3 | P4 | P5 | P6 | P7 |
|-------------|----|----|----|----|----|----|----|----|
| Link Width  | x8 | x2 | x4 | x2 | x8 | x2 | x4 | x2 |

## 5.1.4 PORT-LANE MAPPING

The table below shows the mapping of the lanes to ports in different functional modes.

**Table 5-4 Port-Lane Mapping**

|         | 2-Port | 3-Port | 4-Port | 5-Port | 8-Port |
|---------|--------|--------|--------|--------|--------|
| Lane 0  | P0     | P0     | P0     | P0     | P0     |
| Lane 1  | P0     | P0     | P0     | P0     | P0     |
| Lane 2  | P0     | P0     | P0     | P0     | P1     |
| Lane 3  | P0     | P0     | P0     | P0     | P1     |
| Lane 4  | P0     | P0     | P2     | P0     | P2     |
| Lane 5  | P0     | P0     | P2     | P0     | P2     |
| Lane 6  | P0     | P0     | P2     | P0     | P3     |
| Lane 7  | P0     | P0     | P2     | P0     | P3     |
| Lane 8  | P4     | P4     | P4     | P4     | P4     |
| Lane 9  | P4     | P4     | P4     | P4     | P4     |
| Lane 10 | P4     | P4     | P4     | P5     | P5     |
| Lane 11 | P4     | P4     | P4     | P5     | P5     |
| Lane 12 | P4     | P6     | P6     | P6     | P6     |
| Lane 13 | P4     | P6     | P6     | P6     | P6     |
| Lane 14 | P4     | P6     | P6     | P7     | P7     |
| Lane 15 | P4     | P6     | P6     | P7     | P7     |

Note: Switch supports automatic Lane Reversal within a port. Lane Reversal is supported only when all lanes on the port are occupied (full-lane). Lane Reversal requires that the lanes are still sequentially ordered but the order is reversed.

## 5.2 CLOCK SCHEME

### 5.2.1 REFERENCE CLOCK OPERATION MODES

The Switch supports two different reference clock operational modes defined by CKMODE. If CKMODE is tied to “0”, the Switch sourced from reference clocks is operating under BASE mode. If CKMODE is tied to “1”, the switch driven by reference clocks is operating under Cross Domain Separate Reference clock (CDSR) mode. The configured mode determines how the reference clock sources are connected to REFCLKP/N[2:0] input pins.

For example, when the Switch is configured to be in the BASE mode, all of the 16 lanes are driven by REFCLKP/N[0]. In this mode, REFCLKP/N[2:1] are recommended to be connected to the ground. When the Switch is set to be in CDSR mode, it allows two different reference clock sources to drive these 16 lanes. The users can decide how the reference clocks are connected to the appropriate ports based on the appropriate port lane mapping.

When Switch is configured to be in CDSR mode, chip operates in multiple reference clock domains. In this mode, some of ports work in one reference clock domain while others work in another domain. Each domain can turn on its own SSC function, and the Switch supports SSC isolation feature to allow ports in different SSC domains to transfer packets to each other correctly, given that the frequency differences are within 5600ppm.

The following table illustrates the connections of REFCLKP/N[2:0] in various use cases when CKMODE is set to BASE mode. The reference clock source comes from Root Complex (RC). The clock signal is distributed through buffer or generator to REFCLKP/N[2:0].

**Table 5-5 REFCLKP/N[2:0] connections when BASE mode is chosen**

| Usage Case     | REFCLK Architecture | REFCLKP/N[0]     | REFCLKP/N[2:1] |
|----------------|---------------------|------------------|----------------|
| Single Fan-out | Common/SRNS/SRIS    | RC for all ports | GND            |

If CKMODE is set to CDSR, the use case is similar to dual-host domain. The REFCLK architecture is viewed as in SSC isolation. The Switch can be splitted into 2 host domains with the host port of P0 and P4. These two host ports can be linked at x4 lane-width. The reference clock drives P0 via REFCLKP/N[0], which is the main clock for the entire chip. In this mode, REFCLKP/N[0] is isolated from REFCLKP/N[1], which is connected to P4. REFCLKP/N[0] and REFCLKP/N[1] are sourced differently from the RC in their own host domains. The following table illustrates the connection of REFCLKP/N[1:0] in SSC isolation condition.

**Table 5-6 REFCLKP/N[2:0] connections when CDSR mode is chosen**

| Port 0   | Port 4 | REFCLKP/N[0] | REFCLKP/N[1] | REFCLKP/N[2] |
|----------|--------|--------------|--------------|--------------|
| x8 or x4 | x8     | RC[0]        | RC[1]        | GND          |
| x8 or x4 | x4     | RC[0]        | RC[1]        | RC[0]        |

### 5.2.2 INTEGRATED REFERENCE CLOCK BUFFER

The built-in Integrated Reference Clock Buffer of the PI7C9X3G816GP supports eight reference clock outputs. The strapping pin CKBUFDP\_L to enable or disable the internal clock buffer feature.

When CKBUFDP\_L pin is asserted high, the integrated reference clock buffer is enabled. The clock buffer distributes a single 100 MHz reference clock input to eight referemce clock output paris, REFCLKOP/N[7:0]. The integrated reference clock buffer supports two different operation modes which set by CLKBUF\_CMOS\_EN\_L pins. When CLKBUF\_CMOS\_EN\_L set “1”, the integrated clock buffer requires 100 MHz differential clock inputs through REFCLKIP/N pins as shown in Table 12-4. When CLKBUF\_CMOS\_EN\_L set “0”, REFCLKIP/N are recommended to be connected to the ground.

When CKBUFDP\_L pin is asserted low, the integrated clock buffer is in power down mode and disabled. The 100 MHz reference clock output pairs are disabled.

The connection of REFCLKOP/N[7:0] pins of PI7C9X3G816GP and the reference clock input of downstream port devices have to follow the table shown below if L1.1 is implemented.

**Table 5-7 Connection Map for REFCLKOP/N[7:0]**

| Reference Clock Source Pins      | REFCLKOP[0]<br>REFCLKON[0] | REFCLKOP[1]<br>REFCLKON[1] | REFCLKOP[2]<br>REFCLKON[2] | REFCLKOP[3]<br>REFCLKON[3] | REFCLKOP[4]<br>REFCLKON[4] | REFCLKOP[5]<br>REFCLKON[5] | REFCLKOP[6]<br>REFCLKON[6] | REFCLKOP[7]<br>REFCLKON[7] |
|----------------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|
| Reference Clock Destination Pins | Note                       | Downstream Port 1 device   | Downstream Port 2 device   | Downstream Port 3 device   | Downstream Port 4 device   | Downstream Port 5 device   | Downstream Port 6 device   | Downstream Port 7 device   |

Note: When CKMODE is set to BASE mode, REFCLKP/N[0] can be connected to REFCLKOP/N[0] or external reference clock source. When CKMODE is set to CDSR mode, REFCLKOP/N[0] is un-used and REFCLKP/N[2:0] are connected to external reference clock sources which need belong to the same clock buffer.

The REFCLKOP/N[7:0] is not only enabled or disabled by a global control signal CKBUFDP\_L, but also controlled by CLKREQ\_L[7:0] pins and internal downstream-port device clock status individually based on L1 PM Substate rule. The output control signals for REFCLKOP/N[7:0] are mapped as the following tables.

**Table 5-8 Output Control for REFCLKOP/N[7:0]**

|                             |                            |                            |                            |                            |                            |                            |                            |                            |
|-----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|
| Reference Clock Source Pins | REFCLKOP[0]<br>REFCLKON[0] | REFCLKOP[1]<br>REFCLKON[1] | REFCLKOP[2]<br>REFCLKON[2] | REFCLKOP[3]<br>REFCLKON[3] | REFCLKOP[4]<br>REFCLKON[4] | REFCLKOP[5]<br>REFCLKON[5] | REFCLKOP[6]<br>REFCLKON[6] | REFCLKOP[7]<br>REFCLKON[7] |
| Clock Request Control Pins  | CLKREQ_L[0]                | CLKREQ_L[1]                | CLKREQ_L[2]                | CLKREQ_L[3]                | CLKREQ_L[4]                | CLKREQ_L[5]                | CLKREQ_L[6]                | CLKREQ_L[7]                |

Note: When CKMODE is set to BASE mode, REFCLKP/N[0] can be connected to REFCLKOP/N[0] or external reference clock source. When CKMODE is set to CDSR mode, REFCLKP/N[0] is un-used and REFCLKP/N[2:0] are connected to external reference clock sources which need belong to the same clock buffer.

The CLKREQ\_L[0] is an upstream control signal that should be connected from the switch output with external pull-up to the CLKREQ\_L pin on the host chip (Root Complex). The switch combines the CLKREQ\_L[7:1] and drives the resulting signal out on the CLKREQ\_L[0]. When endpoints do not have any packets to transmit, the switch and endpoints will not drive CLKREQ\_L[7:1], CLKREQ\_L[7:1] will be high due to external pull-up resistor and the reference clock REFCLKOP/N[7:1] for down ports will stop. Then, the switch does not drive the CLKREQ\_L[0] low on its upstream port. If the Root Complex does not have any packets requiring transmission, it does not drive the CLKREQ\_L[0] either. In this case, the CLKREQ\_L[0] will be high due to external pull-up resistor to stop the reference clock source for the upstream port.

If desires to disable some specified Reference Clock Output Paris, it can be done by Port Clock Enable field in the Bifurcation Control Register (offset 55Ch. bit[31:24]) through I2C, SMBUS or EEPROM.

### 5.3 EEPROM Interface

The EEPROM interface consists of four pins: EECK (EEPROM clock), EEDI (EEPROM serial data input), EEDO (EEPROM serial data output) and EECS\_L (EEPROM chip select). The Switch supports 2-, or 3-byte address SPI EEPROM parts and automatically determines the appropriate addressing mode. The EEPROM is used to initialize a number of registers before enumeration. This is accomplished after PERST\_L is de-asserted, at which time the data from the EEPROM is loaded. The EEPROM interface is organized into a 16-bit base, and the Switch supplies an 8-bit EEPROM word address.

#### 5.3.1 EEPROM ACCESS MODES

The Switch may access the EEPROM in a WORD format by either utilizing the auto mode through a hardware sequencer or interactive mode through the host configuration commands. For auto mode, it only happens during chip initialization after system reset (Please refer to 5.3.2 for more details). As to interactive mode, it allows to read/write data from/into the EEPROM by giving the command, address and data via EEPROM Control, address and data configuration registers at offset 30Ch and 310h.

#### 5.3.2 EEPROM MODE AT RESET

During a reset, the Switch automatically loads the information/data from the EEPROM if the automatic load condition is met. The first offset in the EEPROM contains a signature. If the signature is recognized, the autoload initiates right after the reset.

During the autoload, the Switch will read sequential words from the EEPROM and write to the appropriate registers. Before the Switch registers can be accessed through the host, the autoload condition should be verified by reading bit [4] offset [308h](#) (EEPROM Autoload Status). The host access is allowed only after the status of this bit is set to '1' which indicates that the autoload initialization sequence is completed.

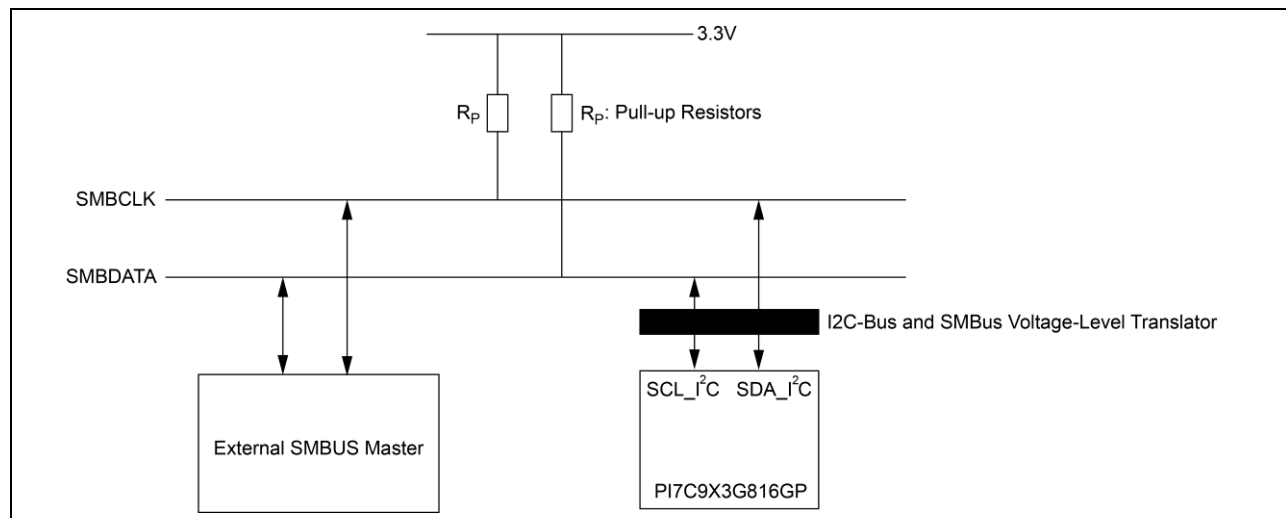

### 5.3.3 EEPROM SPACE ADDRESS MAP

**Table 5-9 EEPROM Space Address Map**

| EEPROM Address | Value            | Description  |
|----------------|------------------|--|
| 00h            | 1516h            | EEPROM signature   |
| 02h            | EEPROM_BYTE_SIZE | EEPROM size byte count   |
| 04h            | CFG_PORT         | 1 <sup>st</sup> Configuration Port Address<br>Bit[7:0]: port number<br>Bit[15:8]: must fix to 00h                    |
| 06h            | CFG_OFFSET_ADDR  | 1 <sup>st</sup> Configuration Register Address<br>Bit [9:0]: configuration register address<br>Bit [15:10]: reserved |
| 08h            | CFG_LOW_DATA     | 1 <sup>st</sup> Configuration Register Data (low word)   |

| 12h            | CFG_HIGH_DATA    | 2 <sup>nd</sup> Configuration Register Data (high word)  |
| ...            | ...              | ...  |
| FFF8h          | CFG_HIGH_DATA    | Last Configuration Register Data (high word)   |

## 5.4 SMBUS INTERFACE

The Packet Switch provides the System Management Bus (SMBus), a two-wire interface through which a simple device can communicate with the rest of the system. The SMBus interface on the Packet Switch is a bi-directional slave interface. It can receive data from the SMBus master or send data to the master. The interface allows full access to the configuration registers. A SMBus master, such as the processor or other SMBus devices, can read or write to every RW configuration register (read/write register). In addition, the RO and HwInt registers (read-only and hardware initialized registers) that can be auto-loaded by the EEPROM interface can also be read and written by the SMBus interface. This feature allows increases in the system expandability and flexibility in system implementation.

**Figure 5-1 SMBus Architecture Implementation**

The SMBus interface on the Packet Switch consists of one SMBus clock pin ([SCL\\_I2C](#)), a SMBus data pin ([SDA\\_I2C](#)), and 3 SMBus address pins ([I2C\\_ADDR\[2:0\]](#)). The SMBus clock pin provides or receives the clock signal. The SMBus data pin facilitates the data transmission and reception. Both of the clock and data pins are bi-directional. The SMBus

address pins determine the address to which the Packet Switch responds to. The SMBus address pins generate addresses according to the following table:

**Table 5-10 SMBUS Address Pin Configuration**

| BIT | SMBus Address |
|-----|---------------|
| 0   | I2C_ADDR[0]   |
| 1   | I2C_ADDR[1]   |
| 2   | I2C_ADDR[2]   |
| 3   | 1             |
| 4   | 0             |
| 5   | 1             |
| 6   | 1             |

Software can change the SMBus Slave address, by programming the SMBus/I2C Control Register SMBus/I2C Device Address field.

The Switch also supports Packet Error Checking and Packet Error Code (PEC) generation, as explained in the SMBus v2.0.

The Switch supports three commands:

- Block Write (command BEh) is used to write CFG registers
- Block Write (command BAh), followed by Block Read (command BDh), is used to read CFG registers
- Block Read - Block Write Process Call (commands BAh, CDh) can also be used to read CFG registers

### 5.4.1 SMBUS BLOCK WRITE

The Block Write command is used to write to the Switch registers. General SMBus Block Writes are illustrated in Figure 5-2 and Figure 5-3. Table 5-1 explains the elements used in Figure 5-2 and Figure 5-3.

**Figure 5-2 SMBus Block Write Command Format, to Write to a Switch Register without PEC**

**Figure 5-3 SMBus Block Write Command Format, to Write to a Switch Register with PEC**

Block Write transactions that are received with incorrect Cmd Code are NACKed, starting from the wrong byte setting, and including subsequent bytes in the packet. For example, if the Byte Count value is not 8, the Switch NACKs the byte corresponding to the Byte Count value, as well as any Data bytes following within the same packet.

The byte after Data Byte 4, if present, is taken as the PEC byte, and if present, the PEC is checked. If a packet fails Packet Error Checking, the Switch drops the packet (ignores the Write), and returns NACK for the PEC byte, to the

SMBus Master. Packet Error Checking can be disabled, by setting the SMBus/I<sup>2</sup>C Control Register PEC Check Disable bit. The Byte Count value, by definition, does not include the PEC byte.

**Table 5-11 Bytes for SMBus Block Write**

| Field (Byte) On Bus | Bit(s)   | Value/ Description  |     |             |   |  |   |   |   |  |   |  |
|---------------------|--|---|-----|-------------|---|--|---|---|---|--|---|--|
| S                   | 1  | <b>START</b> condition  |     |             |   |  |   |   |   |  |   |  |
| P                   | 1  | <b>STOP</b> condition   |     |             |   |  |   |   |   |  |   |  |
| A                   | 1  | <b>Acknowledge</b> (this bit position may be 0 for an ACK or 1 for a NACK)  |     |             |   |  |   |   |   |  |   |  |
| Command Code        | 7:0  | <b>BEh</b> for Block Write  |     |             |   |  |   |   |   |  |   |  |
| Byte Count          | 7:0  | <b>08h</b> = 8 bytes to follow (4 Command and 4 Data bytes). The PEC byte is not counted.   |     |             |   |  |   |   |   |  |   |  |
| Command Byte 1      | 7:3  | <b>Reserved</b>   |     |             |   |  |   |   |   |  |   |  |

| 7           | Command Byte 4 | 2Ah   | Switch Register Address bits [9:2] (for offset A8h)   |

| Byte Number | Byte Type   | Value | Description                         |
|-------------|-------------|-------|-------------------------------------|
| 8           | Data Byte 1 | 12h   | Data Byte for register bits [31:24] |
| 9           | Data Byte 2 | 34h   | Data Byte for register bits [23:16] |
| 10          | Data Byte 3 | 56h   | Data Byte for register bits [15:8]  |
| 11          | Data Byte 4 | 78h   | Data Byte for register bits[7:0]    |

### 5.4.2 SMBUS BLOCK READ

A Block Read command is used to read Switch CFG registers. Similar to CFG register Reads using I<sup>2</sup>C, a SMBus Write sequence must first be performed to select the register to read, followed by a SMBus Read of the corresponding register. There are two ways a Switch register can be read:

- Use a Block Write, followed by a Block Read. The Block Write sets up the parameters including Port Number, register address and Byte Enables, and the Block Read performs the actual Read operation.
- Use a Block Read - Block Write Process Call. This command is defined by the SMBus v2.0, and performs a Block Write and Block Read, using a single command. The Block Write portion of the message sets up the register to be read, and then a repeated START followed by the Block Read portion of the message returns the register data specified by the Block Write

The Switch always NACKs any incorrect command sequences, starting with the wrong Byte. Upon receiving the Block Read command, the Switch returns a PEC to the Master, if after the 4th byte of register data, the Master still requests one more Byte. As a Slave, the Switch recognizes the end of the Master's Read cycle, by observing the Master's NACK response for the last Data Byte transmitted by the Switch.

Incorrect command sequences are always NACK, starting with the byte that is incorrect. (Refer to Table 5-13.) On the Block Read command, a PEC is returned to the Master, if after the 4th byte of CSR data, the return Master still requests for one additional byte. As a Slave, the Switch will know the end of the Master Read cycle, by observing the NACK for the last byte read from the Master.

**A Block Write to set up Read**

**A Block Read which returns CFG Register Value**

□ : Master to Slave  
 ■ : Slave to Master

**Figure 5-4 SMBus Block Write to Set up Read, and Resulting Read that Returns CFG Register Value**

**Table 5-13 Bytes for SMBus Block Read**

| Field (Byte) On Bus | Bit(s) | Value/ Description   |
|---------------------|--------|--|
| S                   | 1      | <b>START</b> condition   |
| P                   | 1      | <b>STOP</b> condition  |
| A                   | 1      | <b>Acknowledge</b> (this bit position may be 0 for an ACK or 1 for a NACK) |
| Command Code        | 7:0    | <b>BAh</b> , to set up Read, using Block Writes                            |

| Field (Byte) On Bus | Bit(s) | Value/Description                      |
|---------------------|--------|--|
| Command Code        | 7:0    | CDh for Block Read (Process Call Read) |

### 5.4.3 CSR READ, USING SMBUS BLOCK READ – BLOCK WRITE PROCESS CALL

A general SMBus Block Read - Block Write Process Call sequence is illustrated in Figure 5-5. Alternatively, a general SMBus Block Read - Block Write Process Call with PEC sequence is illustrated in Figure 5-6

Using this command, the register to be read can be set up and read back with one SMBus cycle (a transaction with a START and ending in STOP). There is no STOP condition before the repeated START condition. The command format for the Block Write part of this command has the same sequence as in Table 5-14, except that the Command Code changes to CDh, as illustrated below. Other Bytes remain the same as used in the sequence for SMBus Block Write followed by Block Read. Table 5-18 lists the Command format for Block Read.

: Master to Slave  
 : Slave to Master

## 5.5 I2C Interface

Inter-Integrated Circuit (I<sup>2</sup>C) is a bus used to connect Integrated Circuits (ICs). Multiple ICs can be connected to an I<sup>2</sup>C Bus, and I<sup>2</sup>C devices that have I<sup>2</sup>C mastering capability can initiate a Data transfer. I<sup>2</sup>C is used for Data transfers between ICs at relatively low rates (100 Kbps), and is used in a variety of applications. For further details regarding I<sup>2</sup>C Buses, refer to the *I<sup>2</sup>C Bus v2.1*.

The Switch is an I<sup>2</sup>C Slave. Slave operations allow the Switch's Configuration Registers to be read from or written to by an I<sup>2</sup>C Master, external from the device. I<sup>2</sup>C is a sideband mechanism that allows the device Configuration registers to be programmed, read from, or written to, independent of the PCI Express upstream Link.

**Figure 5-7 Standard Devices to I2C Bus Connection Block Diagram**

The I<sup>2</sup>C interface on the Packet Switch consists of a I<sup>2</sup>C clock pin ([SCL I2C](#)), a I<sup>2</sup>C data pin ([SDA I2C](#)), and 3 I<sup>2</sup>C address pins ([I2C\\_ADDR\[2:0\]](#)). The I<sup>2</sup>C clock pin provides or receives the clock signal. The I<sup>2</sup>C data pin facilitates the data transmission and reception. Both of the clock and data pins are bi-directional. The I<sup>2</sup>C address pins determine the address to which the Packet Switch responds to. The I<sup>2</sup>C address pins generate addresses according to the following table:

**Table 5-19 I<sup>2</sup>C Address Pin Configuration**

| BIT | I2C Address |
|-----|-------------|
| 0   | I2C_ADDR[0] |
| 1   | I2C_ADDR[1] |
| 2   | I2C_ADDR[2] |
| 3   | 1           |
| 4   | 0           |
| 5   | 1           |
| 6   | 1           |

Software can change the I<sup>2</sup>C Slave address, by programming the SMBus/I<sup>2</sup>C Control Register SMBus/I<sup>2</sup>C Device Address field.

### 5.5.1 I2C REGISTER WRITE ACCESS

The Switch Configuration registers can be read from and written to, based upon I<sup>2</sup>C register Read and Write operations, respectively. An I<sup>2</sup>C Write packet consists of Address Phase bytes and Command Phase bytes, followed by one to four additional I<sup>2</sup>C Data bytes. Table 5-18 defines mapping of the I<sup>2</sup>C Data bytes to the Configuration register Data bytes.

The I<sup>2</sup>C packet starts with the S (START condition) bit. Data bytes are separated by the A (Acknowledge Control Packet (ACK)) or N (Negative Acknowledge (NAK)) bit. The packet ends with the P (STOP condition) bit.

If the Master generates an invalid command, the targeted Switch register is not modified. The Switch considers the 1st Data byte of the 4-byte Data phase, following the four Command bytes in the Command phase, as register Byte 3 (bits [31:24]). The next three Data bytes access register Bytes 2 through 0, respectively. Four Data bytes are required, regardless of the Byte Enable Settings in the Command phase. The Master can then generate either a STOP condition (to finish the transfer) or a repeated START condition (to start a new transfer). If the I<sup>2</sup>C Master sends more than the

four Data bytes (violating Switch protocol), further details regarding J2C protocol, the Switch returns a NAK for the extra Data byte(s).

Table 5-21 describes each I<sup>2</sup>C Command byte for Write access. In the packet described in Figure 5-8, Command Bytes 0 through 3 for Writes follow the format specified in Table 5-21.

**Table 5-20 I2C Register Write Access**

| I2C Data Byte Order | PCI Express Configuration Register Byte |
|---------------------|---|
| 0                   | Written to register Byte 3              |
| 1                   | Written to register Byte 2              |
| 2                   | Written to register Byte 1              |
| 3                   | Written to register Byte 0              |

**Table 5-21 I2C Command Format for Write Access**

| Byte                | Bit(s)   | Description   |                    |
|---------------------|--|---|--------------------|

The following tables illustrate a sample I2C packet for writing the Switch SSID/SSVID register (offset [A8h](#)) for Port 0, with data 1234\_5678h.

**Note:** The Switch has a default I<sup>2</sup>C Slave address [6:0] value of 68h, with the I2C\_ADDR[2:0] input having a value of 000. The byte sequence on the I<sup>2</sup>C Bus, as listed in the following tables, occurs after the START and before the STOP bits, by which the I<sup>2</sup>C Master frames the transfer.

**Figure 5-9 I2C Register Write Access Example**

**I<sup>2</sup>C Register Write Access Example – Address Cycle**

| Phase   | Value | Description  |
|---------|-------|--|
| Address | D0h   | Bits [7:1] for Switch I <sup>2</sup> C Slave Address (68h) with last bit (bit 0) for Write = 0 |

### 5.5.2 I2C REGISTER READ ACCESS

When the I<sup>2</sup>C Master attempts to read a Switch register, two packets are transmitted. The 1<sup>st</sup> packet consists of Address and Command Phase bytes to the Slave. The 2<sup>nd</sup> packet consists of Address and Data Phase bytes.

According to the I<sup>2</sup>C Bus, v2.1, a Read cycle is triggered when the Read/Write bit (bit 0) of the 1<sup>st</sup> cycle is Set. The Command phase reads the requested register content into the internal buffer. When the I<sup>2</sup>C Read access occurs, the internal buffer value is transferred on to the I<sup>2</sup>C Bus, starting from Byte 3 (bits [31: 24]), followed by the subsequent

bytes, with Byte 0 (bits [7:0]) being transferred last. If the I<sup>2</sup>C Master requests more than four bytes, the Switch re-transmits the same byte sequence, starting from Byte 3 of the internal buffer.

The 1<sup>st</sup> and 2<sup>nd</sup> I<sup>2</sup>C Read packets perform the following functions:

- 1<sup>st</sup> packet - Selects the register to read
- 2<sup>nd</sup> packet - Reads the register (sample 2<sup>nd</sup> packet provided is for a 7-bit Switch I<sup>2</sup>C Slave address)

Although two packets are shown for the I<sup>2</sup>C Read, the I<sup>2</sup>C Master can merge the two packets together into a single packet, by not generating the STOP at the end of the first packet (Master does not relinquish the bus) and generating REPEAT START.

Table 5-22 describes each I<sup>2</sup>C Command byte for Read access. In the packet described in Figure 5-11, command Bytes 0 through 3 for Reads follow the format specified in Table 5-22.

**Table 5-22 I<sup>2</sup>C Command Format for Read Access**

| Byte                | Bit(s)   | Description  |                    |
|---------------------|--|--|--------------------|

## 6 HOT PLUG SUPPORT

The hot plug usages can be classified into surprised and managed types depending on the application scenario. Each type has two different control and status interfaces: serial and parallel. The switch implements both surprised/managed and serial/parallel hot-plug types in the downstream ports. The [HOT PLUG EN L](#) strapping pin should be set to “0” to enable hot plug function in the downstream ports of the switch.

### 6.1 HOT PLUG TYPES

#### 6.1.1 SURPRISED SERIAL HOT PLUG

If the device is inserted or removed asynchronously from downstream port, it is called surprised hot plug. When SURPRISE\_HP strapping pin is set to “1”, the chip is operating under surprised hot plug mode.

- Hot Insertion Procedures:
  - Present Detect Pin (i.e. PDC\_L[7:0]) is asserted
  - The corresponding “Presence Detect Change” and “Present Detect State” in slot status reflect the card is in the slot
  - Enable the corresponding reference clock output (i.e. REFCLKOP/N[7:0]) to the hot inserted device
  - Issue INTx Message or MSI to notify software processing hot plug event
  - Wait for 628 ms and then deassert the corresponding downstream reset (i.e. HP\_RST\_L[7:0])
  - If DL\_UP is set, then generating INTx Message or MSI to notify software initiating configuration cycles to the hot inserted device
  
- Hot Removal Procedures
  - The device is removed asynchronously or under abnormal condition (Ex. Human Error ...)
  - Either in-band or out-band Present Detect sensing device being removed
  - Commands LTSSM state machine to Detect.Quiet state
  - Upstream port replies UR status that any TLP being sent to this downstream port
  - Any packet stored in input queue of upstream port will be dropped silently
  - Assert Present detect change Interrupt to system software
  - Enable DPC trigger event and assert DPC interrupt and unmasked non-fatal message to system software
  - Turn off the corresponding output clock buffer and assert the corresponding hot plug reset signal

During power-up, the chip scans IO Expander like devices through I2C clock and data signals (i.e. SHCL\_I2C and SHDA\_I2C). According to the reference design described in LED management, one set of I2C bus serves 4 CPLD, which converts the serial bus into 8-bit parallel bus. The 8-bit mapping is defined in Table 6-1.

**Table 6-1 CPLD Signal Name Mapping for 8-bit IO Expander**

| BIT | DIRECTION | CPLD SIGNAL NAME      |
|-----|-----------|-----------------------|
| 0   | O         | FAULT                 |
| 1   | O         | LOCATE                |
| 2   | N/A       | Not used (Debug Only) |
| 3   | N/A       | Not used (Debug Only) |
| 4   | I         | PRSNT_L               |
| 5   | N/A       | Not used (Debug Only) |
| 6   | N/A       | Not used (Debug Only) |
| 7   | N/A       | Not used (Debug Only) |

Among these signals, ATNLED and PWRLED defined in PCIe specification are repurposed to represent FAULT and LOCATE to be compliant with SFF-8489 for blinking LEDs. For details, please refer to LED Management specification.

The switch hot plug controller supports multiple I2C/SMBUS-like control interfaces. Each interface can serve up to 8 downstream ports. The I2C/SMBUS address for slave devices is started from 40h by default. In addition, this initial address is configurable through EEPROM to registers LTSSM/IOE CSR6 Bit[30] and LTSSM/IOE CSR7 Bit[6:0]. Each downstream port is correspondent to one equivalent 8-bit IO expander with the following Port/Address mapping table.

**Table 6-2 Port/Address Mapping for 8-bit IO Expander**

| Downstream Port Number | P1  | P2  | P3  | P4  | P5  | P6  | P7  | P8  |
|------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Address                | 40h | 41h | 42h | 43h | 44h | 45h | 46h | 47h |

### 6.1.2 SURPRISED PARALLEL HOT PLUG

The parallel mode of Surprised Hot Plug is very similar to its serial mode except that no CPLD is required to control LED. Instead, the chip outputs LED signals (i.e. HP\_LED [7:0]) to drive Amber LED directly and the blinking follows SFF-8489 IBPI specification.

### 6.1.3 MANAGED SERIAL HOT PLUG

If the device is inserted or removed synchronously with hot-plug management software from downstream port, it is called managed hot plug. When SURPRISE\_HP strapping pin is set to “0”, the chip is operating under managed hot plug mode.

- Hot Insertion Procedures:
  - User inserts card
  - User closes MRL
  - User initiates hot-inserted sequence by pressing Attention Button
  - System commands slot control register to drive indicators and power on slot
  - System starts re-enumeration the hierarchy under the slot
- Hot Removal Procedures:
  - User initiates hot-removed sequence by pressing Attention Button
  - System informs application/driver to complete current task
  - System commands slot control register to drive indicators and power off slot
  - System disabled the hierarchy under the slot
  - User opens MRL and removes the card

During the process of hot insertion and removal, there are hot plug events corresponding to slot status bits ready for generation. When [Hot-Plug Interrupt Enable](#) bit is set, either MSI or INT message is issued to notify S/W for processing.

When power-up, the chip uses I2C clock and data signals to scan either 16-bit or 40-bit IO Expander dependent on the status of strapping pin (i.e. [IO\\_EXP\\_TYPE](#)). The IO Expander responds an interrupt (i.e. [HPCINT\\_L](#)) to notify any hot plug signal status change and the chip will read back the status change in serial mode and reflect on slot status register. The 16-bit mapping of managed hot plug events for I2C bit sequence is defined in Table 6-3

**Table 6-3 CPLD Signal Name Mapping for 16-bit IO Expander**

| BIT | DIRECTION | CPLD SIGNAL NAME |
|-----|-----------|------------------|
| 0   | O         | PWRLED_L         |
| 1   | O         | ATNLED_L         |
| 2   | O         | PWREN            |
| 3   | O         | RECLKEN          |
| 4   | O         | PERST_L          |
| 5   | O         | INTERLOCK        |
| 6   | N/A       | N/A              |
| 7   | I         | SLOT#[0]         |
| 8   | I         | SLOT#[1]         |
| 9   | I         | SLOT#[2]         |
| 10  | I         | SLOT#[3]         |
| 11  | I         | PRSNT_L          |
| 12  | I         | MRL_L            |
| 13  | I         | ATNBTN_L         |
| 14  | I         | PWRFLT_L         |
| 15  | I         | PWRGOOD          |

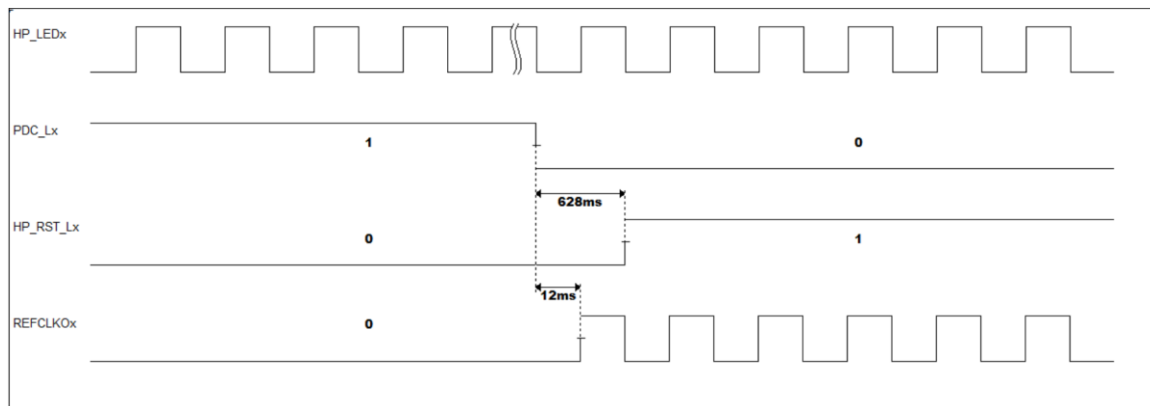

Similar to Surprised Serial Hot Plug, each downstream port is correspondent to one equivalent 16-bit IO expander with the following Port/Address mapping table.

**Table 6-4 Port/Address Mapping for 16-bit IO Expander**

| Downstream Port Number | P1  | P2  | P3  | P4  | P5  | P6  | P7  | P8  |
|------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Address                | 40h | 42h | 44h | 46h | 48h | 4Ah | 4Ch | 4Eh |

## 6.2 TIMING SEQUENCE FOR SURPRISED HOT PLUG OPERATION

Two timing charts are shown below to illustrate surprised hot insertion or removal under different scenarios. The first chart presents the timing relationship between system reset/reference\_clock and individual downstream reset/reference\_clock under initial power-up condition. The second chart demonstrates the timing sequence of clock and reset for device inserted or removed under power active condition.

**Figure 6-1 Timing Sequence for Surprised Hot Plug Insertion Operation**

**Figure 6-2 Timing Sequence for Surprised Hot Plug Removal Operation**

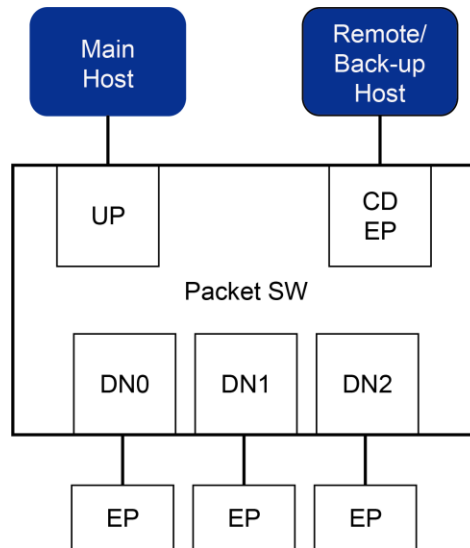

## 7 CROSS-DOMAIN END-POINT

### 7.1 GENERAL DESCRIPTION

The PCIe Packet Switch supports Cross-Domain End-Point (CDEP) function. The function, when working in conjunction with the software running on the Main Host, enables data exchange among multiple PCIe-based hosts. This feature allows the system to implement fail-over or co-processor functionalities. These two use cases are briefly described in the following sections with the suitable CDEP Mode Switch Model for the use case.

#### 7.1.1 FAIL-OVER

In an error resilient system, a Remote/Back-up Host is set up to take over the Main Host in the event when Main Host has failed and the failure is detected. The CDEP Mode Switch Model facilitates the data exchange across domains of the Main and Remote/Back-up Hosts, and swaps the roles of the hosts in the event of the Main Host's failure. The CDEP Mode Switch Model used in the fail-over use case is shown in the illustration below.

**Figure 7-1 Switch Reference Model Used in the Fail-Over Use Case**

In the event when the Main Host is unable to send regular messages to the Remote/Back-up Host, the Remote/Back-up host can swap its role to the Main Host and its CDLEP port being an agent of upstream port to handle the traffic to/from downstream ports. The previous Main Host's upstream port will be reset during the link-down process initiated by the previous Main Host. The Switch has to ensure that the reset does not propagate to the entire upstream hierarchy in the previous Main Host's, so that the new Main Host can seamlessly manage the original End-Points. As a result, the impacts to the entire system are minimal during the fail-over transition.

#### 7.1.2 CO-PROCESSOR

The co-processor can be connected to the CDLEP port to off-load the computation on the Main Host. The illustration below shows a Remote Host/Co-processor unit (CP), which works with the Main Host to form a two-processor system. The DMA function of the Main Host's upstream port is enabled to move data among the Main Host and Remote Host/Co-processor to accelerate intensive computation tasks.

**Figure 7-2 Switch Reference Model Used in the Co-Processor Use Case**

## 7.2 PORT CONFIGURATION

The Main Host can configure a Link CDEP port as a generic PCIe End-Point. This allows the Remote Host(s) the ability to link to the switch CDEP port during PCIe enumeration. The enumeration process includes BIOS start-up, operating system start-up, and/or subsequent PCIe hot-plug or dynamic enumerations initiated by the host operating system.

Before the Main Host can enable the CDEP function, the Switch has to be configured into the CDEP mode and designate the CDEP port to as the upstream port of a generic end-point. The configuration is performed through EEPROM programming at power-up. In order to operate in the CDEP mode, the Switch is required to set Chip CD Mode and Switch CD Mode for the CDEP port configurations. The Chip CD Mode and Switch CD Mode are defined in the Device Configuration 0 and 2 Registers respectively.

In order to support the CDEP mode, the Switch has to contain a Cross-Domain Virtual End-Point (CDVEP). The CDVEP acts as an agent to bridge the Main Host and other host domain, and only exists in the Switch.

In addition to the CDVEP, the Switch has another type of End-Point, called Cross-Domain Line End-Point (CDLEP). The CDLEP is visible to the Remote Host (RH), but not the Main Host. The CDLEP bridges the communications between the Remote Host and other Remote Host. The table below describes the CDEP port's configurations by the Switch types.

**Table 7-1 CDEP Mode Configuration**

| Switch CD Mode | CDEP Configuration               |
|----------------|----------------------------------|
| 0x             | Both CDEPs disabled              |
| 10             | Illegal Configuration            |
| 11             | CDVEP enabled, and CDLEP enabled |

Only P4 can be designated as a CDLEP port. Once the port is chosen as CDLEP port, the port number defined in Link Capability Register and MMIO Register offsets will be changed accordingly.

## 7.3 BAR TRANSLATION FOR REMOTE HOST DOMAIN

The Main Host configures a set of CDEP Link address translations to the Switch. The translations allow the Remote Host to access the CDEP Link's 64-bit BAR2/BAR3 and BAR4/BAR5 similar to accessing the other HOST locations. The Main Host software is responsible for managing the memory regions appropriately to implement and emulate the CDLEP end-point behaviors.

The Main Host defines either or both of a Direct Address Translation (DAT) range, and an Address Look-up Table (ALUT) for the BAR translations for the Remote Host to access to other HOST memory locations. The Main Host configures these settings prior to enabling the CDLEP port. After the Main Host programs the CDLEP port's BARs, the Remote Host is able to read/write to the Main Host or other Remote Host memory locations.

### 7.3.1 DIRECT ADDRESS TRANSLATION (DAT)

The Main Host arranges a contiguous memory block in the Remote Host domain by setting BAR Configuration registers with the chosen DAT. The BAR2/BAR3 and BAR4/BAR5 have their own corresponding contiguous memory blocks. These memory blocks are characterized by the Base bits and Window Size bits. If the upper address of incoming TLP matches with the Base bits, the upper address will be replaced with the translated address stored in Base Translation Registers ([BTR2/BTR3](#) and [BTR4/BTR5](#)). The lower address bits are defined by the Window Size bits and remain intact. They are considered to be an offset address from the base address. The Window Size is determined by the BAR configuration, and the minimum size is 1MB.

### 7.3.2 ADDRESS LOOK-UP TRANSLATION (ALUT)

In addition to the Direct Address Translation, the BAR2/BAR3 provides an alternative address translation mechanism, Address Look-Up Translation (ALUT). The ALUT allows multiple translated address blocks in a non-contiguous address range. The Window Size bits defined earlier can be partitioned into 7 index bits and the rest lower address bits can form Page Size bits. The minimum page size is 8KB (1MB divided by 128). The 7 index bits are used to access 128 entries. Each entry represents a translated address block and the host domain destination it is associated with.

The ALUT Access Control Registers at offset from [918h](#) to [920h](#) in the CDLEP is used to store 128 entries. When performing ALUT entry write, the software has to program the ALUT data into the CDLEP at offset [91Ch](#) and [920h](#) if the translated address is 64-bit. The software then updates the index and Command (set to write) fields of the CDLEP at offset [918h](#). When performing LUT entry read, the software has to program index and Command (set to read) fields of the CDLEP at offset [918h](#), and then read [91Ch](#) and [920h](#) to get the LUT data.

### 7.3.3 ID TRANSLATION

In the event when a PCIe read or write is initiated in the Remote Host PCIe domain, and the read/write targets the Main Host memory or an end-point in the Main Host PCIe domain, the PCIe Requestor ID field in the TLP header that targets the Main Host must be *translated* into the PCIe Requestor ID of the CDVEP. This is to ensure that the IOMMU access permissions granted by the Main Host operating system, virtual machine, and/or end-point driver, apply to these translated TLPs. If the target is to another Remote Host PCIe domain, the PCIe Requestor ID has to be translated into the PCIe Requestor ID of the destination CDLEP to ensure that a legal ID is used by the destination Remote Host system. The domain id of the Main Host is 0. That of the Remote Host is 1.

## 7.4 BAR TRANSLATION FOR MAIN HOST DOMAIN

The Main Host also configures a set of CDEP Virtual address translations. The address translations allow accesses to a defined address range to be translated to the Remote Host memory addresses.

Similar to BAR Translation on the Remote Host domain described previously, the BAR Translation on the Main Host domain also supports two different approaches: the Direct Address Translation and the Address Look-Up table Translation. Please refer to the section of [CDVEP CONFIGURATION REGISTERS](#) for related BAR translation setup registers such as [BAR Configuration](#), [BTR](#), [ALUT Access Control](#), and more.

The RID translation in Main Host domain is the same as the translation in the Remote Host domain. The only difference is in building the RID LUT. However, the [RID table](#) is programmed by the Main Host in the default setting, not by hardware automatically.

## 7.5 SCRATCHPADS AND DOORBELLS

The CDEP Link and virtual interfaces may provide a set of switch-specific scratchpad and doorbell registers for uses in Remote Host-to-Main Host/Remote Host communication. By definition, custom driver or diagnostic code is required to run on the hosts. As a result, the Main Host or Remote Host must determine their visibility when a CDEP port emulates a generic End-Point. The registers must appear in PCIe configuration space in user-defined regions.

If the Main Host intends to make the scratchpad and doorbell registers visible to the host, the Main Host should define a CDEP Link property that enables a non-prefetchable 32-bit BAR0 containing these scratchpad and doorbell registers. A 4K range is allocated for CDLEP within the BAR0 at an offset address defined in the table in section 9.2.3 of the register reference document

In each CDLEP or CDVEP, there are 8 sets of 32-bit scratchpad registers (CDLEP at offset [9E4h~A00h](#), and CDVEP at offset [9E4h~A00h](#)), and one set of 32-bit doorbell registers (CDLEP offset [9C4h~9D0h](#) and CDVEP offset [9C4h~9D0h](#)). The scratchpad registers are used to store information for communication among Remote Hosts and Main Host. The doorbell registers are utilized to process (set/clear/mask/unmask) interrupt in order to notify the destination host to fetch the data stored in scratchpad registers of the source host. The scratchpad registers can only be written by the host in same domain while doorbell registers can be set/clear by both of hosts either in the same domain or in different domain. If the Main Host uses the PCIe configuration command to access scratchpad and doorbell registers, it keep track of its End-Point-defined region and restrict its range so it does not go over the offset 9C4h. If the memory commands are used to access these registers in the CDLEP, the Main Host has to enable a non-prefetchable 32-bit BAR3. A 4K range is allocated for CDLEP within the BAR0/1 at an offset address defined in the address table of Device Specific Memory Mapped Configuration Mechanism.

## 8 DIRECT MEMORY ACCESS

### 8.1 GENERAL DESCRIPTION

The Switch provides two DMA engines. These are hardware blocks that includes a set of buffers to asynchronously read and write to I/O memory through the Switch's ports. Each DMA engine is configured through a corresponding PCIe Function, managed by a software device driver running on a connected Remote Host (RH) or Main Host (MH). The DMA engine is divided into single or multiple physical channels (2 per engine), providing a reserved portion of the buffer pool, and access to a set of virtual channels (2 per physical channel). The virtual channels allow the software initiator to submit lock-free requests, or partition access to the channel among a set of cooperating software subsystems. The initiator accesses the DMA engine using a physical/virtual channel (hereafter abbreviated as channel) to submit descriptors. Each descriptor tells the engine to read from a DMA source into one of the channel's internal buffers, and then performs a corresponding write to a DMA destination.

The Switch's DMA engines can be configured in a variety of ways, including:

- Device Status Collection: A host CPU can off-load blocking MMIO reads of device status registers to the DMA engine for asynchronous processing.
- Peer-to-Peer EP Transfer: A host CPU can off-load memory copies between a set of managed devices in the Switch.
- Peer-to-Peer Remote Host Transfer: A set of cooperating Remote Hosts connected through a pair of [CDEP](#) ports can use the DMA Engine as a RH-to-RH memory transport, implementing a message queue.

In this section, any description of register layouts and data formats uses little-endian ordering.

### 8.2 DMA CONFIGURATION

The Switch's EEPROM or a micro-controller connected via I2C interface first configures the Switch's DMA engines (functions), enabling the DMA functions to appear underneath appropriate ports. Then, the software attaches a DMA driver to the DMA function based on the software model for the switch deployment to initialize and manage the set of channels (descriptor queues), start/stop/restart the channels, and perform appropriate error handling.

#### 8.2.1 DMA FUNCTIONS

The Switch's EEPROM and switch configuration registers are set to indicate the ports under which the DMA functions will be visible to the connected RH or MH. This may include upstream ports, CDEP Link Ports, or virtual upstream ports.

The [Device Configuration #2 Register \(offset 50Ch\)](#) defined in upstream port (Port 0) is used to configure DMA function (bit[19:18]) under various CD modes (bit[17:16]) (Please refer to [CDEP chapter](#) for CD mode definition). The DMA mode definition is represented by the following table.

**Table 8-1 DMA Mode definition**

| DMA Mode | DMA Configuration                                     |
|----------|---|
| 0x       | DMA functions disabled                                |
| 10       | DMA functions enabled for P0 or P4 based upon CD mode |
| 11       | DMA functions enabled for P0 only                     |

### 8.2.1.1 DMA MODE BIT DEFINITION

- bit[1]: Decides if DMA function is enabled in the port connected to RH or MH.  
0: DMA function is disabled  
1: DMA function is enabled
- bit[0]: Determines if DMA function only visible to the MH's domain  
0: DMA function is visible to its own remote host or the MH's domain  
1: DMA function is only visible to the MH's domain

### 8.2.1.2 DMA MODE AND CD MODE

DMA function is defined in the various ports under different CD and DMA mode settings. These ports are respectively “P0 port” and “CDLEP port”. A comprehensive table as shown below illustrates how the DMA functions (F1 or F2) being assigned to these three types of ports in terms of CD and DMA modes.

**Table 8-2 DMA Function Definition in P0 and CDLEP Under Various Modes**

| CD Mode | DMA Mode | P0/F0    | P0/F1/F2 | P4/F0     | P4/F1 |
|---------|----------|----------|----------|-----------|-------|
| 00      | 00       | Up-Port  | N/A      | Down-Port | N/A   |
| 00      | 01       | Up-Port  | N/A      | Down-Port | N/A   |
| 00      | 10       | Up-Port  | 2 DMAs   | Down-Port | N/A   |
| 00      | 11       | Up-Port  | 2 DMAs   | Down-Port | N/A   |
| 01      | 00       | Up-Port  | N/A      | Down-Port | N/A   |
| 01      | 01       | Up-Port  | N/A      | Down-Port | N/A   |
| 01      | 10       | Up-Port  | 2 DMAs   | Down-Port | N/A   |
| 01      | 11       | Up-Port  | 2 DMAs   | Down-Port | N/A   |
| 11      | 00       | Up-Port* | N/A      | CDLEP     | N/A   |
| 11      | 01       | Up-Port* | N/A      | CDLEP     | N/A   |
| 11      | 10       | Up-Port* | 1 DMA    | CDLEP     | 1 DMA |
| 11      | 11       | Up-Port* | 2 DMAs   | CDLEP     | N/A   |

Note: Up-Port\* means that CDLEP exists in the Up-Port host domain

### 8.2.1.3 ENUMERATION

The PCIe configuration space for each port that has been configured for DMA will enumerate one or more DMA Functions (Type 0 configuration space headers), with a well-defined vendor, device, and class code indicating DMA, and a set of control registers associated with a non-prefetchable BAR. Software will enumerate each DMA Function and program BARs. These configuration registers for [function #1 or function #2](#) is defined in the chapter 9 of this document.

## 8.2.2 DMA CONTROL REGISTER

DMA engine (i.e. function) provides [a set of interface registers](#) for software to control the operation and monitor the status of DMA transfer for all channels managed by this function. These registers are accessed by mmio via a base address defined in non-prefetchable BAR0 and BAR1 registers associated with the channel and individual register offset defined in the section 5 of this document. For each channel, it will add an additional 100h offset to indicate the interface registers of one channel located in a 256-byte block. Hence, the access to one particular interface register in one of channels requires to set the address offset as follows: register offset + (number of channel) x 100h. Software can check the Channel ID field (bit[31:28]) of DMA Control and Status Register 0 at offset 00h to see if it is accessing the desired channel.

### 8.2.2.1 DMA DESCRIPTOR REGISTER

The DMA control register space will include a 64-bit pointer to the i/o address base of each channel's descriptor ring, and the size of the descriptor ring. Software will program the DMA registers to configure each descriptor ring, from which a channel will prefetch. The channel will support a total size for each descriptor ring of at most 4096 entries.

#### 8.2.2.1.1 DESCRIPTOR POINTER REGISTER

The I/O address base of each channel's descriptor ring is pointed by a [64-bit channel descriptor ring base pointer at register offset 0Ch and 10h](#). The software has to program these registers, so the hardware can prefetch the descriptors starting from there.

#### 8.2.2.1.2 DESCRIPTOR SIZE REGISTER

The size of descriptor ring can be programmed in [register offset 24h](#) (bit[12:0] in Channel Descriptor Ring Size for Prefetch register). The maximum descriptor ring size is 4096 entries. The bit[28:16] of this register indicates the next descriptor index is going to be prefetched.

### 8.2.2.2 DMA OPERATIONAL REGISTER

The DMA control register space will include a control register ([DMA Control and Status Register 1](#) at register offset 20h) for each channel to start, stop, abort, pause, and resume DMA activity for the channel. Software will update the control register to start the engine once it is ready to begin submitting requests. Software will update the control register if it needs to pause, stop, or otherwise reconfigure a channel.

After starting the DMA activity for that virtual channel (i.e. write "1" to bit[0] of DMA Control and Status Register 1), the software can update the control register any time by commanding the DMA engine to pause, abort or stop operation. Following is a summary for these three operations.

#### 8.2.2.2.1 PAUSE (bit[1])

When set, the DMA activity is paused to the next active descriptor after completing the processing on current descriptor. Then, the DMA Pause Done status (bit[16]) is turned on to represent the DMA is in "paused" condition. If DMA Pause Interrupt Enable (bit[3]) is set, an interrupt will be issued to notify the software when bit[16] is set. For pause operation, there is no any descriptor or data being dropped and the DMA operation can be resumed any time by clearing the Pause Control (bit[1]).

#### 8.2.2.2.2 ABORT (bit[2])

When set, the DMA activity drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The pointer will move to the next active descriptor. Then, the DMA Abort Done status (bit[17]) is turned on to represent the DMA is in "aborted" condition. If DMA Abort Interrupt Enable (bit[6]) is set, an interrupt will be issued to notify the software when bit[17] is set. In abort condition, the DMA operation can be resumed any time by clearing the Abort Control (bit[2]) and setting DMA Start (bit[0]). Then, DMA begins to process the next active descriptor. In fact, the software is also allowed to reprogram interface registers for re-initialization and start from the base descriptor pointer.

#### 8.2.2.2.3 STOP (bit[7])

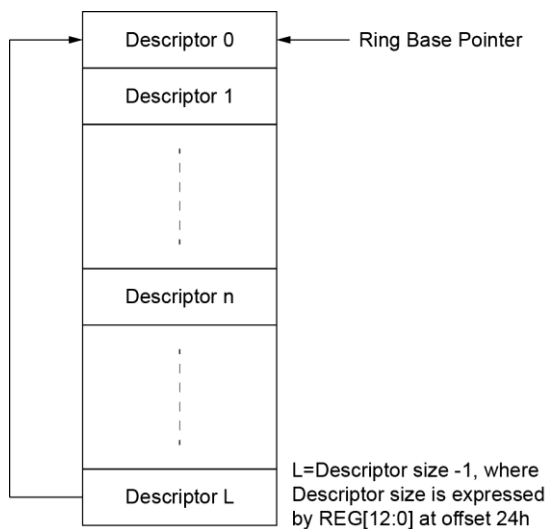

When set, the DMA activity drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The channel interface registers are all cleaned to default state except Interrupt flag bit if DMA stop enable is set earlier. Then, the DMA Stop Done status (bit[18]) is turned on to represent the DMA is in "stopped" condition. If DMA Stop Interrupt Enable (bit[5]) is set, an interrupt will be issued to notify the software when bit[18] is set. In stop condition, the data buffer contents pointed by the previous processed descriptor will be dropped as well, so the software needs to reprogram interface registers for re-initialization before resuming DMA activity by setting DMA Start (bit[0]).

## 8.3 DMA DESCRIPTORS AND TRANSFERS

Each DMA channel will initiate descriptor pre-fetch when the channel is enabled and its ownership register is updated, indicating the valid range of descriptors to prefetch. When a valid descriptor is found, a DMA transfer will be scheduled with the underlying DMA engine in a fair manner with respect to other descriptors from other channels. The descriptor will be re-written by the DMA engine when the DMA transfer is complete, or if the DMA transfer fails due to an error. The switch will also update the ownership register to indicate the range of completed descriptors. Software will then examine the completed descriptors and take appropriate action.

### 8.3.1 DESCRIPTORS

Descriptors are located in the system memory. All of descriptors in a ring have to be concatenated together without gap (see figure 1. below). The switch will calculate the address offset automatically by adding the index of descriptor multiplied with the byte count of a single-descriptor to the ring base descriptor pointer for prefetch.

**Figure 8-1 DMA Descriptor Map**

#### 8.3.1.1 INITIALIZATION

Software will initialize a valid descriptor by writing it to memory at the next free location in a channel's descriptor ring. Software will ensure that the descriptor's valid bit is written only after all other descriptor fields have been initialized. Software will update the ownership register to schedule execution of all initialized descriptors with the DMA engine.

#### 8.3.1.2 OWNERSHIP

After all descriptor fields have been initialized, Software will update the ownership registers located at the register offset 04h and 08h by setting valid status. The [descriptor ownership 0 register](#) (04h) represents the first 32 descriptors' valid status starting from bit[0] while the [descriptor ownership 1 register](#) (08h) stands for the next 32 descriptors' valid status. The switch will pre-fetch the descriptors with valid status turned on continuously until the descriptor with valid status being cleared. After the descriptors have been processed, the switch will update the ownership registers by clearing valid status in the order it was received.

#### 8.3.1.3 PRE-FETCH

Software needs to update the Channel Descriptor Ring Size for [Pre-fetch register at offset 24h](#) by writing total descriptor numbers into bit[12:0]. Starting from the 1st descriptor pointed by ring base pointer register (0Ch and 10h),

the descriptors will be pre-fetched by the switch continuously. The Channel Descriptor Current Pointer register at offset 14h indicates which descriptor is under processing. The switch will also take a residual function over the descriptor numbers divided by 64. If the remainder is less than or equal to 64, the switch will go back to prefetch the 1st descriptor after hitting the last descriptor.

When Software prepares to update the ownership registers during the DMA operation, it requires to check Descriptor current pointer (14h) viewed by the switch in order to update the correct 64-bit sliding window, which is advanced in terms of descriptor units.

## 8.3.2 TRANSFER

Software will define in the descriptor a 64-bit i/o source address, 64-bit i/o destination address, and transfer length up to 8MB. Switch will divide the DMA transfer into appropriate pairs of Memory Read and Write TLPs based on the current switch settings for `Max_Payload_Size` and `Max_Read_Request_Size`, along with any 4k boundaries crossed by the range of addresses. Other than 64-bit i/o source and 64-bit i/o destination address, Software will also define 4-bit source domain and 4-bit destination domain in the descriptor for moving data across domains. Switch needs to generate Read or Write TLPs with a translated RID if the TLP destined domain is different from the domain where the DMA function is located.

### 8.3.2.1 LOCAL DOMAIN TRANSFER

For a local DMA transfer (i.e. no crossing host domains, the SDV and DDV must be “0” in the CTRL word of descriptors), the switch will refer to [Max Payload Size](#) and [Max Read Request Size](#) defined in PCIe configuration space in where the DMA function is resided for generating MRD and MWR TPLs along with any 4k boundaries crossed by the range of addresses.

### 8.3.2.2 CROSS DOMAIN TRANSFER

As to a cross-host-domain DMA transfer (i.e. either SDV or DDV or both are “0”), the switch will refer to `Max_Payload_Size` and `Max_Read_Request_Size` of other host domains defined in register offset [28h, 2Ch and 30h](#), which are usually programmed by Main Host. The switch will check the domain id carried in descriptor to choose the appropriate `Max_Payload_Size` and `Max_Read_Request_Size` for creating MRD and MWR TLPs. Please note that the Main Host software has to program the correct values of `Max_Payload_Size` and `Max_Read_Request_Size` for each domain by following the definition in PCIe configuration device control registers of that domain. Otherwise, it will cause undesired result in packet transfers.

As the DMA transfer source domain is different from destination domain, the Requester ID needs to be translated into a legal BDF ID of the destination domain. The software is required to program the captured bus number of CDV or CDL into domain bus number defined in register offset [34h, 38h and 3Ch](#). Regarding the captured bus number, the software can refer to CDEP data 0 register at offset A04h of CD port. The switch will check the domain id carried in descriptor to choose the appropriate bus number for creating RID of MRD and MWR TLPs.

## 8.3.3 DESCRIPTOR LAYOUT

The descriptor is formed by an 8-DW data block. The Figure 2 (see below) presents the layout of these DWs containing control word, source domain/address, destination domain/address, transfer byte count and others.

**Figure 8-2 DMA Descriptor Layout in an 8-DW block**

### 8.3.3.1 DOMAIN AND ADDRESS FIELD

The 64-bit I/O destination address and source address are located from the 3rd DW to 6th DW. They must be D-Word aligned. Also in the 7th DW, it defines the destination domain id (bit[7:0]) and source domain id (bit[15:8]) used for cross-domain DMA operation. Each domain id is expressed by LSB 2-bit that represents for 2 different host domain (0 ~ 3) supported by one packet switch. As to LSB 2-bit and MSB 4-bit, they are reserved for future use.

### 8.3.3.2 TRANSFER COUNT FIELD

The bit[22:0] in the 2nd DW stands for the transfer byte count for one descriptor can be up to 8MB.

### 8.3.3.3 CONTROL FILED

There are several bits defined in CTRL field of 1st DW for further formatting and enabling the source and destination locations. Please see Table 8-3 for illustrating bit definition in CTRL filed.

**Table 8-3 Bit Definition in CTRL Field of the 1<sup>st</sup> DW**

| Bit | Name  | Description                   |
|-----|-------|-------------------------------|
| 31  | EOT   | End of transfer               |
| 30  | INT   | Issue interrupt when DMA done |
| 29  | TPH   | TPH function enable           |
| 28  | NOP   | No operation                  |
| 27  | FLH   | Dlush any cached data         |
| 26  | SAV   | Source address is valid       |
| 25  | DAV   | Destination address is valid  |
| 24  | 64bit | Rnable 64 bit address         |
| 23  | SAV   | Source domain is valid        |
| 22  | DDV   | Destination domain is valid   |
| 21  | CRC   | Enable CRC checksum           |

- ◇ EOT(End of Transfer): Defined in bit[31]. When set, it indicates the current DMA transfer is completed. The interpretation on EOT is various for different DMA modes. If the EOT valid bit defined in the DMA control register 0 is set, the switch will update the EOT bit in descriptor from 0 to 1 after transfer count indicated in descriptor is ended.
- ◇ 64bit: Defined in bit[24]. When set, the I/O address is in 64-bit physical memory. Otherwise, it is in 32-bit physical memory.
- ◇ SAV: Defined in bit[26]. When set, it means the I/O source address is valid. If cleared, the I/O source address is not valid, which is the condition that only destination DMA channel is enabled for executing host to host DMA.
- ◇ DAV: Defined in bit[25]. When set, it means the I/O destination address is valid. If cleared, the I/O destination address is not valid, which is the condition that only source DMA channel is enabled for executing host to host DMA.

- ◇ SDV: Defined in bit[23]. When set, it means the source domain id is valid and MRD will be issued to that domain by following its max payload size and read request size. It implies that DMA source and DMA function (or descriptors) are located in different domains. If cleared, it might be in the condition of either only DMA destination is positioned in a different domain from DMA function or just for a local (i.e. same domain) DMA transfer between source and destination.
- ◇ DDV: Defined in bit[22]. When set, it means the destination domain id is valid and MWR will be issued to that domain by following its max payload size. It implies that DMA destination and DMA function (or descriptors) are located in different domains. If cleared, it might be in the condition of either only DMA source is positioned in a different domain from DMA function or just for a local (i.e. same domain) DMA transfer between source and destination.
- ◇ NOP: Defined in bit[28]. Software can configure a no-op (zero length) descriptor by setting NOP of CTRL field. Once this bit is turned on, that performs no Reads or Writes. and
- ◇ FLH: Defined in bit[27]. Software can configure a cache flush descriptor by setting FLH of CTRL field. A cache flush descriptor, that forces the DMA engine to flush its buffer cache, and cancel any outstanding DMA Reads (thereby avoiding lengthy Completion Timeout conditions). Once this bit is turned on, the DMA activity drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The channel interface registers are all cleaned to default state as well. Software can check if DMA Start (bit[0] of register at offset 20h) is cleared to ensure “flush” event has completed. This “flush” feature provides a way for Software to restart DMA operation in terms of reinitializing the DMA ring buffer and interface registers.
- ◇ INT: Defined in bit[30]. Software may configure a descriptor with a flag (setting INT of CTRL field) to interrupt the software device driver on the completion (or failure) of the corresponding descriptor, using an interrupt mechanism defined by the containing DMA Function’s configuration registers. Software needs to clear the interrupt status by writing “1” to the bit[31] (Interrupt Flag) of register at offset 20h.
- ◇ In DMA Engine (Function) Configuration registers for function 1 or 2, it defines various interrupt mechanisms such as INTx Interrupt message enabled by bit[10] of command register at offset 04h (via configuration space), MSI/Multiple MSI enabled by bit[16]/bit[22:20] of MSI control register at offset 48h or MSI-X enabled by bit[31] of MSI-X control register at offset B0h.
- ◇ TPH: Defined in bit[29]. Software may configure a descriptor with a flag (setting TPH of CTRL field) to indicate that the posted memory writes issued by the DMA engine for this descriptor should include a set of TLP Processing Hints (TPH). The TPH will consist of setting the TH bit in each posted write’s TLP header, and incorporating an 8-bit ST (7:0) steering tag data field that is found in the DMA descriptor. The steering tag in the TLP header is copied from ST value defined in bit[7:0] of 1st DW in descriptor.

#### 8.3.3.4 ERR FIELD

This 5-bit field can encode into 32 errors at most. In descriptor level, the DMA might detect the following errors such as Data Poison (encoded as 12, which is corresponding to bit[12] in AER), Completion Time-Out (bit[14]), Completer Abort (bit[15]), ECRC error (bit[19]) and Unsupported Request (bit[20]). If there are more than two errors (included) happening at the same time, it always reports the error defined with the least bit.

#### 8.3.3.5 ST FIELD

It represents 8-bit steering tag. This 8-bit data is valid only when TPH bit set in control field.

#### 8.3.3.6 CRC FIELD

Software may configure a descriptor with a flag to indicate that the DMA engine should compute a CRC-32 checksum of the data bytes (not including headers) that were read as part of the DMA transfer. The calculated CRC-32 will be written back to the descriptor on completion.

By setting CRC of CTRL field (bit[21] of the 1st DW), it enables DMA engine to compute a CRC-32 checksum over the raw data bytes of buffer pointed by the descriptor. It uses PCIe ECRC-32 polynomial and calculation is in a DW alignment. Upon the completion of descriptor processing, the final CRC-32 checksum result will be written back to the 8th DW of descriptor.

## 8.4 ERROR REPORTING AND HANDLING

The software managing a DMA function and associated channels must be able to define appropriate error handling behaviors for the DMA processing, including the handling of DMA memory read failures. To implement appropriate error handling for DMA:

### 8.4.1 ERROR REPORTING

Software will discover the Advanced Error Reporting (AER) capability in the configuration space of each DMA Function. Software will then enable AER, and configure the AERUCES, AERUCEM, AERUCESEV, AERCS, AERCEM, AERCC, AERHL, and AERTLP registers appropriately. The switch will update these registers and issue M\_ERR messages as the DMA engine detects errors when processing a descriptor from the corresponding function. The switch will also rewrite the descriptor affected by an error with an error status field, indicating the corresponding PCIe error that caused the DMA to fail (e.g. DP, ECRC, CTO).

#### 8.4.1.1 REPORTING VIA FUNCTION

In DMA Engine (Function) Configuration registers for function 1 or 2, it defines Advanced Error Reporting (AER) capability at byte offset 100h that followed by AERUCES, AERUCEM, AERUCESEV, AERCES, AERCEM, AERCC and AERHL registers from a byte offset 104h to 128h.

#### 8.4.1.2 REPORTING VIA CHANNEL

When processing any descriptor in all of channels assigned to that DMA function, it will issue UCE\_MSG If any of UCE is detected and also the corresponding UCE bit in AERUCEM is cleared. Meanwhile, the AERUCES would be copied to Channel UCES register defined in DMA interface register at offset 44h, so it will know which channel causing UCE. Furthermore, bit[25:24] of Channel UCES register will also indicate what type of DMA transaction running into Uncorrectable error. Bit[24] represents the detected error happening in fetching descriptor while bit[25] shows that error detected in reading data into DMA buffer. The DMA engine will issue interrupt if UCE Interrupt Enable bit (bit[17] of DMA Control and Status 0) is turned on.

#### 8.4.1.3 REPORTING VIA DESCRIPTOR

To continuously trace down from where the UCE is coming, the DMA engine will also write back the error status to the descriptor which is affected by an error with a 5-bit error status field (bit[12:7] of 1st DW in descriptor). A 5-bit error status field can represent any of the PCIe UEs defined in AERUCES (e.g. error field=12 in descriptor would mean DP because DP is the 12th bit of AERUCES). Once Multiple UEs happen simultaneously, the lowest bit position in AERUCES will be recorded. (e.g. if DP (bit[12] in AERUCES) and Malformed TLP (bit[18] in AERUCES) are detected, only the DP reported as error since it is a lowest bit)

### 8.4.2 ERROR LOGGING

The DMA Function will provide a default (or configurable) value for AERCAP + 18h AERCC.MHRC, and errors will be logged appropriately into AERHL and AERTLP as detected when processing a descriptor from the corresponding function. The default value for AERCC.MHRC is zero, so there is only one TLP header with error(s) will be logged into AERHL.

### 8.4.3 DATA INTEGRITY

The switch will implement ECRC checking and ECRC generation for TLPs passing through the DMA engine. As such, the DMA Function will set AERCC.ECC=1 and AEREGC=1 in the AER capability, DMA Reads will verify ECRC, and DMA Writes will generate ECRC.

In AERCC register of DMA function configuration space, it defines ECC (bit[7]) and EGC (bit[5]) as “1” so the system software can set ECE = 1 (bit[8]) and EGE = 1 (bit[6]) to enable the switch to perform ECRC checking and ECRC generation for TLPs passing through the DMA engine.

## 8.4.4 ERROR HANDLING FOR UNCORRECTABLE ERROR DETECTED

The switch will provide software the channel status to determine whether a particular detected error will automatically stop the channel, or simply mark the descriptor as being in error, and continue processing the next descriptor. Once detecting uncorrectable error, the DMA will write back error status into the descriptor which is affected by error(s). Also, the switch will take the following steps for two scenarios.

### 8.4.4.1 ERROR IN DATA BUFFER

If the error occurs in the TLPs that are CPLDs for storing into DMA data buffer, the DMA activity drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The pointer will move to the next active descriptor and this would be treated like an H/W abort event. This channel is aborted and it is up to Software to restart DMA from the next descriptor or re-program the DMA control register to start from the base descriptor.

### 8.4.4.2 ERROR IN DESCRIPTOR

If the error occurs in the TLPs that are CPLDs for storing into Prefetch descriptor cache, the DMA activity not only drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data, but also dumps the following descriptors since they are damaged as well. So this channel is stopped and requires Software to reprogram interface registers for re-initialization before resuming DMA activity by setting DMA Start (bit[0]).

## 8.4.5 ERROR HANDLING FOR DMA READ

The switch will provide a register for the DMA function that software can use to determine whether an error on DMA Memory Read will cause the function and/or descriptor to report an error immediately (without writing), or will cause the function and/or descriptor to report an error only after writing to the DMA destination address a Poisoned (DP) Memory Write TLP for each corresponding Memory Read that failed.

If the UCE occurring in DMA read for CPLDs acquired from source address, the error report scheme (bit[18] in DMA Control and Status Register 0) can be configured in two different modes.

- ◇ If bit[18] is set, DMA reports UCE event after writing DP TLP to destination address. The DP TLP is generated for each corresponding memory read that failed.
- ◇ If bit[18] is cleared, DMA reports UCE event immediately without writing DP TLP to destination address.

## 9 REGISTER DESCRIPTION

### 9.1 REGISTER TYPES

This chapter details the Packet Switch registers, including

- Bit names
- Description of register functions
- Type, refer to Table 9-1
- Whether the default value can be modified by EEPROM and/or I2C/SMBUS
- Default value

**Table 9-1 Register Types**

| REGISTER TYPE | DEFINITION                      |
|---------------|---------------------------------|
| RO            | Read Only                       |
| RW            | Read / Write                    |
| RWIC          | Read / Write 1 to Clear         |
| RWIO          | Read/Write 1 Only               |
| RsvdP         | RO and must return 0 when read. |

### 9.2 REGISTER ACCESS

Each Switch Port implements a 4-KB Configuration Space which includes the lower 256 bytes PCI-compatible Configuration Space, and the upper 3840 bytes PCI Express Extended Configuration Space. There are several mechanisms can access the Configuration Space:

- PCI-compatible Configuration Mechanism
- PCI Express Enhanced Configuration Access Mechanism
- Device-specific Memory Mapped Configuration Mechanism
- I2C Slave Interface
- SMBUS Slave Interface

#### 9.2.1 PCI-COMPATIBLE CONFIGURATION MECHANISM

The PCI-compatible Configuration Mechanism provides standard access to the first 256 bytes of the PCI Express Configuration Space. The mechanism uses PCI Type 0 and Type 1 Configuration transactions to access the Packet Switch Configuration registers.

#### 9.2.2 PCI EXPRESS ENHANCED CONFIGURATION ACCESS MECHANISM

The PCI Express Enhanced Configuration Access Mechanism is implemented on all PCI Express PCs. It provides a memory-mapped address space in the root complex, through which the root complex translates a memory access into one or more configuration requests. Device drivers normally use an application programming interface (API) provided by the Operating System (OS) to use this mechanism. The mechanism can access all Packet Switch registers.

#### 9.2.3 DEVICE\_SPECIFIC MEMORY MAPPED CONFIGURATION MECHANISM

The Device-Specific memory-Mapped Configuration Mechanism provides a method to access the configuration registers of all ports in a single 512KB memory map. The registers of each port are contained within a 4-KB range.

To use this mechanism, BIOS/OS needs to set BAR 0 and BAR 1 registers of up port at boot time. After BAR 0 and BAR 1 are enumerated, Port 0 registers can be access with Memory Reads from and Writes to the first 4 KB, Port 1 registers can be accessed with Memory Reads from and Writes to the 2<sup>nd</sup> , and so forth.

| Physical Location Index | Port Number | BAR 0/1 Offset |
|-------------------------|-------------|----------------|
| Port 0                  | 0000_0000b  | 0_0000h        |
| Port 1                  | 0000_0001b  | 0_1000h        |
| ...                     | ...         | ...            |
| Port 7                  | 0000_0111b  | 0_7000h        |
| CDEP 1                  | 1001_0000b  | 7_0000h        |
| CQ Header Location      | N/A         | 6_F000h        |

Note: “Port Number” is defined in link capabilities register (offset 74h) bit[31:24].

### 9.3 TRANSPARENT MODE CONFIGURATION REGISTERS

When the port of the Switch is set to operate at the transparent mode, it is represented by a logical PCI-to-PCI Bridge that implements type 1 configuration space header. The following table details the allocation of the register fields of the PCI 2.3 compatible type 1 configuration space header.

| 31 – 24  | 23 – 16                                | 15 – 8   | 7 – 0  | BYTE OFFSET |
|--|--|--|--|-------------|
| <a href="#">Device ID</a>                                      |  | <a href="#">Vendor ID</a>                                  |  | 00h         |
| <a href="#">Primary Status</a>                                 |  | <a href="#">Command</a>                                    |  | 04h         |
| <a href="#">Class Code</a>                                     |  | <a href="#">Revision ID</a>                                |  | 08h         |

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability

registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

| 31 - 24  | 23 - 16   | 15 - 8   | 7 - 0 | BYTE OFFSET |
|--|---|--|-------|-------------|

| 30    | Signaled System Error     | RW1C  | Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR Enable bit in the Command register is 1b.  | No/Yes               | 0       |
| 31    | Detected Parity Error     | RW1C  | Set to 1b whenever the primary side of the port in a Switch receives a Poisoned TLP.  | No/Yes               | 0       |

### 9.3.5 REVISION ID REGISTER – OFFSET 08h

| BIT | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT                            |
|-----|----------|------|--------------------------------------|----------------------|------------------------------------|
| 7:0 | Revision | RO   | Indicates revision number of device. | Yes                  | 0Fh for Port 0<br>06h for Port 1-7 |

### 9.3.6 CLASS REGISTER – OFFSET 08h

| BIT   | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|------|---|----------------------|---------|
| 15:8  | Programming Interface | RO   | Read as 00h to indicate no programming interfaces have been defined for PCI-to-PCI Bridges. | No                   | 00h     |
| 23:16 | Sub-Class Code        | RO   | Read as 04h to indicate device is a PCI-to-PCI Bridge.                                      | No                   | 04h     |
| 31:24 | Base Class Code       | RO   | Read as 06h to indicate device is a Bridge device.  | No                   | 06h     |

### 9.3.7 CACHE LINE REGISTER – OFFSET 0Ch

| BIT | FUNCTION        | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-----------------|------|---|----------------------|---------|
| 7:0 | Cache Line Size | RW   | The cache line size register is set by the system firmware and the operating system cache line size. This field is implemented by PCI Express devices as a RW field for legacy compatibility, but it has no impact on any PCI Express device functionality. | No/Yes               | 00h     |

### 9.3.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

| BIT  | FUNCTION              | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------------|-------|--------------|----------------------|---------|
| 15:8 | Primary Latency Timer | RsvdP | Not support. | No                   | 00h     |

### 9.3.9 HEADER TYPE REGISTER – OFFSET 0Ch

| BIT   | FUNCTION    | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------|------|---|----------------------|---------|
| 22:16 | Header Type | RO   | Read as 01h to indicate that the register layout conforms to the standard PCI-to-PCI Bridge layout. | No                   | 01h     |

| BIT | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT                  |
|-----|-----------------------|------|---|----------------------|--------------------------|
| 23  | Multi-Function Device | RO   | 0b: Single function device<br>1b: Multiple functions device | No                   | 0 if DMA=0<br>1 if DMA=1 |

### 9.3.10 BASE ADDRESS 0 REGISTER – OFFSET 10h (Upstream Port Only)

| BIT   | FUNCTION               | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|-------|--|----------------------|---------|
| 0     | Memory Space Indicator | RO    | Reset to 0 to indicate Memory Base address.                          | No                   | 0       |
| 2:1   | 64-bit Addressing      | RO    | 00b: 32-bit addressing<br>10b: 64-bit addressing<br>Others: Reserved | No                   | 00b     |
| 3     | Prefetchable           | RO    | 0b: Non-prefetchable<br>1b: Prefetchable                             | No                   | 0       |
| 18:4  | Reserved               | RsvdP | Not support.   | No                   | 0-0h    |
| 31:19 | Base Address 0 [31:19] | RW    | Use this Memory base address to map the packet switch registers.     | No/Yes               | 0-0h    |

### 9.3.11 BASE ADDRESS 1 REGISTER – OFFSET 14h (Upstream Port Only)

| BIT  | FUNCTION               | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------------------|------|--|----------------------|------------|
| 31:0 | Reserved               | RO   | When the Base Address 0 register is not 64-bit addressing ( <a href="#">offset 10h[2:1]</a> is not 10b).   | No                   | 0000_0000h |
|      | Base Address 0 [63:32] | RW   | When the Base Address 0 register is 64-bit addressing. Base Address 1 is used to provide the upper 32 Address bits when <a href="#">offset 10h[2:1]</a> is set to 10b. | No/Yes               |            |

### 9.3.12 PRIMARY BUS NUMBER REGISTER – OFFSET 18h

| BIT | FUNCTION           | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------|------|---|----------------------|---------|
| 7:0 | Primary Bus Number | RW   | Indicates the number of the PCI bus to which the primary interface is connected. The value is set in software during configuration. | No/Yes               | 00h     |

### 9.3.13 SECONDARY BUS NUMBER REGISTER – OFFSET 18h

| BIT  | FUNCTION             | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------------------|------|---|----------------------|---------|
| 15:8 | Secondary Bus Number | RW   | Indicates the number of the PCI bus to which the secondary interface is connected. The value is set in software during configuration. | No/Yes               | 00h     |

### 9.3.14 SUBORDINATE BUS NUMBER REGISTER – OFFSET 18h

| BIT   | FUNCTION               | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|------|---|----------------------|---------|
| 23:16 | Subordinate Bus Number | RW   | Indicates the number of the PCI bus with the highest number that is subordinate to the Bridge. The value is set in software during configuration. | No/Yes               | 00h     |

### 9.3.15 SECONDARY LATENCY TIMER REGISTER – OFFSET 18h

| BIT   | FUNCTION                | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------|-------|--------------|----------------------|---------|
| 31:24 | Secondary Latency Timer | RsvdP | Not support. | No                   | 00h     |

### 9.3.16 I/O BASE ADDRESS REGISTER – OFFSET 1Ch

| BIT | FUNCTION                 | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------------|------|---|----------------------|---------|
| 3:0 | 32-bit Indicator         | RO   | Read as 1h to indicate 32-bit I/O addressing.   | Yes                  | 1h      |
| 7:4 | I/O Base Address [15:12] | RW   | Defines the bottom address of the I/O address range for the Bridge to determine when to forward I/O transactions from one interface to the other. The upper 4 bits correspond to address bit[15:12] and are writable. The lower 12 bits corresponding to address bit[11:0] are assumed to be 0. The upper 16 bits corresponding to address bit[31:16] are defined in the I/O base address upper 16 bits address register. | No/Yes               | Fh      |

### 9.3.17 I/O LIMIT ADDRESS REGISTER – OFFSET 1Ch

| BIT   | FUNCTION                  | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------|------|--|----------------------|---------|
| 11:8  | 32-bit Indicator          | RO   | Read as 1h to indicate 32-bit I/O addressing.  | Yes                  | 1h      |
| 15:12 | I/O Limit Address [15:12] | RW   | Defines the top address of the I/O address range for the Bridge to determine when to forward I/O transactions from one interface to the other. The upper 4 bits correspond to address bit[15:12] and are writable. The lower 12 bits corresponding to address bit[11:0] are assumed to be FFFh. The upper 16 bits corresponding to address bit[31:16] are defined in the I/O limit address upper 16 bits address register. | No/Yes               | 0h      |

### 9.3.18 SECONDARY STATUS REGISTER – OFFSET 1Ch

| BIT   | FUNCTION                  | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------|-------|---|----------------------|---------|
| 20:16 | Reserved                  | RsvdP | Not support.  | No                   | 0_0000b |
| 21    | 66MHz Capable             | RsvdP | Not support.  | No                   | 0       |
| 22    | Reserved                  | RsvdP | Not support.  | No                   | 0       |
| 23    | Fast Back-to-Back Capable | RsvdP | Not support.  | No                   | 0       |
| 24    | Master Data Parity Error  | RW1C  | Set to 1b (by a requester) whenever a Parity error is detected or forwarded on the secondary side of the port in a Switch.<br><br>If the Parity Error Response Enable bit is cleared, this bit is never set.  | No/Yes               | 0       |
| 26:25 | DEVSEL_L timing           | RsvdP | Not support.  | No                   | 00b     |
| 27    | Signaled Target Abort     | RW1C  | Set when the Secondary Side for Type 1 Configuration Space header Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted Request as a Completer Abort error. | No/Yes               | 0       |
| 28    | Received Target Abort     | RsvdP | Not support.  | No                   | 0       |
| 29    | Received Master Abort     | RsvdP | Not support.  | No                   | 0       |
| 30    | Received System Error     | RW1C  | Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR Enable bit in the Bridge Control register is 1.  | No/Yes               | 0       |
| 31    | Detected Parity Error     | RW1C  | Set to 1b whenever the secondary side of the port in a Switch receives a Poisoned TLP.  | No/Yes               | 0       |

### 9.3.19 MEMORY BASE ADDRESS REGISTER – OFFSET 20h

| BIT | FUNCTION | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------|-------|--------------|----------------------|---------|
| 3:0 | Reserved | RsvdP | Not support. | No                   | 0h      |

| BIT  | FUNCTION                   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------------------------|------|---|----------------------|---------|
| 15:4 | Memory Base Address [15:4] | RW   | Defines the bottom address of an address range for the Bridge to determine when to forward memory transactions from one interface to the other. The upper 12 bits correspond to address bit[31:20] and are able to be written to. The lower 20 bits corresponding to address bit[19:0] are assumed to be 0. | No/Yes               | 000h    |

### 9.3.20 MEMORY LIMIT ADDRESS REGISTER – OFFSET 20h

| BIT   | FUNCTION                     | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|-------|---|----------------------|---------|
| 19:16 | Reserved                     | RsvdP | Not support.  | No                   | 0h      |
| 31:20 | Memory Limit Address [31:20] | RW    | Defines the top address of an address range for the Bridge to determine when to forward memory transactions from one interface to the other. The upper 12 bits correspond to address bit[31:20] and are writable. The lower 20 bits corresponding to address bit[19:0] are assumed to be FFFFh. | No/Yes               | 000h    |

### 9.3.21 PREFETCHABLE MEMORY BASE ADDRESS REGISTER – OFFSET 24h

| BIT  | FUNCTION                                 | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--|------|---|----------------------|---------|
| 3:0  | 64-bit addressing                        | RO   | Read as 1h to indicate 64-bit addressing.   | No                   | 1h      |
| 15:4 | Prefetchable Memory Base Address [31:20] | RW   | Defines the bottom address of an address range for the Bridge to determine when to forward memory read and write transactions from one interface to the other. The upper 12 bits correspond to address bit[31:20] and are writable. The lower 20 bits are assumed to be 0. The memory base register upper 32 bits contain the upper half of the base address. | No/Yes               | 000h    |

### 9.3.22 PREFETCHABLE MEMORY LIMIT ADDRESS REGISTER – OFFSET 24h

| BIT   | FUNCTION                     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|------|---|----------------------|---------|
| 19:16 | 64-bit addressing            | RO   | Read as 1h to indicate 64-bit addressing.   | No                   | 1h      |
| 31:20 | Memory Limit Address [31:20] | RW   | Defines the top address of an address range for the Bridge to determine when to forward memory transactions from one interface to the other. The upper 12 bits correspond to address bit[31:20] and are writable. The lower 20 bits corresponding to address bit[19:0] are assumed to be FFFFh. | No/Yes               | 000h    |

### 9.3.23 PREFETCHABLE MEMORY BASE ADDRESS UPPER 32-BITS REGISTER – OFFSET 28h

| BIT  | FUNCTION  | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---|------|--|----------------------|------------|
| 31:0 | Prefetchable Memory Base Address, Upper 32-bit[63:32] | RW   | Defines the upper 32-bits of a 64-bit bottom address of an address range for the Bridge to determine when to forward memory read and write transactions from one interface to the other. | No/Yes               | 0000_0000h |

### 9.3.24 PREFETCHABLE MEMORY LIMIT ADDRESS UPPER 32-BITS REGISTER – OFFSET 2Ch

| BIT  | FUNCTION   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--|------|---|----------------------|------------|
| 31:0 | Prefetchable Memory Limit Address, Upper 32-bit[63:32] | RW   | Defines the upper 32-bits of a 64-bit top address of an address range for the Bridge to determine when to forward memory read and write transactions from one interface to the other. | No/Yes               | 0000_0000h |

### 9.3.25 I/O BASE ADDRESS UPPER 16-BITS REGISTER – OFFSET 30h

| BIT  | FUNCTION                              | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---------------------------------------|------|--|----------------------|------------|
| 15:0 | I/O Base Address, Upper 16-bit[31:16] | RW   | Defines the upper 16-bits of a 32-bit bottom address of an address range for the Bridge to determine when to forward I/O transactions from one interface to the other. | No/Yes               | 0000_0000h |

### 9.3.26 I/O LIMIT ADDRESS UPPER 16-BITS REGISTER – OFFSET 30h

| BIT   | FUNCTION                               | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|-------|--|------|---|----------------------|------------|
| 31:16 | I/O Limit Address, Upper 16-bit[31:16] | RW   | Defines the upper 16-bits of a 32-bit top address of an address range for the Bridge to determine when to forward I/O transactions from one interface to the other. | No/Yes               | 0000_0000h |

### 9.3.27 CAPABILITY POINTER REGISTER – OFFSET 34h

| BIT | FUNCTION           | TYPE | DESCRIPTION                                       | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------|------|---|----------------------|---------|
| 7:0 | Capability Pointer | RO   | Pointer points to first PCI capability structure. | Yes                  | 40h     |

### 9.3.28 INTERRUPT LINE REGISTER – OFFSET 3Ch

| BIT | FUNCTION       | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------|------|--|----------------------|---------|
| 7:0 | Interrupt Line | RW   | The interrupt line register communicates interrupt line routing information. | No/Yes               | 00h     |

### 9.3.29 INTERRUPT PIN REGISTER – OFFSET 3Ch

| BIT  | FUNCTION      | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT                    |
|------|---------------|------|--|----------------------|----------------------------|
| 15:8 | Interrupt Pin | RO   | The Switch implements INTA virtual wire interrupt signals to represent hot-plug events at downstream ports.<br><br>0b: disable INTA<br>1b: enable INTA | Yes                  | 00h for Up<br>01h for Down |

### 9.3.30 BRIDGE CONTROL REGISTER – OFFSET 3Ch

| BIT | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-----------------------|------|---|----------------------|---------|
| 16  | Parity Error Response | RW   | 0b: Ignore Poisoned TLPs on the secondary interface<br>1b: Enable the Poisoned TLPs reporting and detection on the secondary interface  | No/Yes               | 0       |
| 17  | S_SERR# Enable        | RW   | 0b: Disables the forwarding of EER_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary interface<br>1b: Enables the forwarding of EER_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary interface   | No/Yes               | 0       |
| 18  | ISA Enable            | RW   | 0b: Forwards downstream all I/O addresses in the address range defined by the I/O Base, I/O Base, and Limit registers<br>1b: Forwards upstream all I/O addresses in the address range defined by the I/O Base and Limit registers that are in the first 64KB of PCI I/O address space (top 768 bytes of each 1KB block) | No/Yes               | 0       |
| 19  | VGA Enable            | RW   | 0b: Ignores access to the VGA memory or IO address range<br>1b: Forwards transactions targeted at the VGA memory or IO address range<br><br>VGA memory range starts from 000A 0000h to 000B FFFFh<br>VGA IO addresses are in the first 64KB of IO address space.  | No/Yes               | 0       |

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------|-------|--|----------------------|---------|
|       |                            |       | AD [9:0] is in the ranges 3B0 to 3BBh and 3C0h to 3DFh.  |                      |         |
| 20    | VGA 16-bit Decode          | RW    | 0b: Executes 10-bit address decoding on VGA I/O accesses<br>1b: Executes 16-bit address decoding on VGA I/O accesses   | No/Yes               | 0       |
| 21    | Master Abort Mode          | RsvdP | Not support.   | No                   | 0       |
| 22    | Secondary Bus Reset        | RW    | 0b: Does not trigger a hot reset on the corresponding PCI Express Port<br>1b: Triggers a hot reset on the corresponding PCI Express Port<br><br>At the downstream port, it asserts PORT_RST# to the attached downstream device.<br><br>At the upstream port, it asserts the PORT_RST# at all the downstream ports. | No/Yes               | 0       |
| 23    | Fast Back-to-Back Enable   | RsvdP | Not support.   | No                   | 0       |
| 24    | Primary Master Timeout     | RsvdP | Not support.   | No                   | 0       |
| 25    | Secondary Master Timeout   | RsvdP | Not support.   | No                   | 0       |

| 27    | Discard Timer SERR# Enable | RsvdP | Not support.   | No                   | 0       |
| 31:28 | Reserved                   | RsvdP | Not support.   | No                   | 0h      |

### 9.3.31 POWER MANAGEMENT CAPABILITIES REGISTER – OFFSET 40h

| BIT   | FUNCTION                       | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------|-------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID       | RO    | Read as 01h to indicate that this is power management capability register.   | Yes                  | 01h     |
| 15:8  | Next Item Pointer              | RO    | Point to next capability structure.  | Yes                  | 48h     |
| 18:16 | Power Management Revision      | RO    | Read as 011b to indicate the device is compliant to Revision 1.2 of <i>PCI Power Management Interface Specifications</i> . | No                   | 011b    |
| 19    | PME# Clock                     | RO    | Does not apply to PCI Express. Must be hardwired to 0.   | No                   | 0       |
| 20    | Reserved                       | RsvdP | Not support.   | No                   | 0       |
| 21    | Device specific Initialization | RO    | Read as 0b to indicate Switch does not have device specific initialization requirements.                                   | Yes                  | 0       |
| 24:22 | AUX Current                    | RO    | Reset to 0.  | Yes                  | 000b    |
| 25    | D1 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D1 power management state.  | Yes                  | 0       |
| 26    | D2 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D2 power management state.  | Yes                  | 0       |
| 31:27 | PME# Support                   | RO    | Read as 19h to indicate Switch supports the forwarding of PME# message in D0, D3 and D4 states.                            | Yes                  | 19h     |

### 9.3.32 POWER MANAGEMENT DATA REGISTER – OFFSET 44h

| BIT | FUNCTION      | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|---------------|-------|--|----------------------|---------|
| 1:0 | Power State   | RW    | Indicates the current power state of the Switch. Writing a value of D0 when the previous state was D3 cause a hot reset without asserting DWRST_L.<br><br>00b: D0 state<br>01b: D1 state<br>10b: D2 state<br>11b: D3 hot state | No/Yes               | 00b     |
| 2   | Reserved      | RsvdP | Not support.   | No                   | 0       |
| 3   | No_Soft_Reset | RO    | When set, this bit indicates that device transitioning from D3hot to D0 does not perform an internal reset. When clear, an internal reset is performed when power state transits from D3hot to D0.                             | Yes                  | 1       |
| 7:4 | Reserved      | RsvdP | Not support.   | No                   | 0h      |

| BIT   | FUNCTION    | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------|------|--|----------------------|---------|
| 8     | PME# Enable | RW   | When asserted, the Switch will generate the PME# message.  | No/Yes               | 0       |
| 12:9  | Data Select | RW   | Select data registers.<br>RW if <a href="#">offset 4C4h[9]</a> =1 and RO if <a href="#">offset 4C4h[9]</a> =0. | No/Yes               | 0h      |
| 14:13 | Data Scale  | RO   | Reset to 00b.  | No                   | 00b     |
| 15    | PME Status  | RW1C | Read as 0b as the PME# message is not implemented.   | No/Yes               | 0       |

### 9.3.33 PPB SUPPORT EXTENSIONS REGISTER – OFFSET 44h

| BIT   | FUNCTION                            | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------------|-------|--------------|----------------------|---------|
| 21:16 | Reserved                            | RsvdP | Not support. | No                   | 00h     |
| 22    | B2_B3 Support for D3 <sub>HOT</sub> | RsvdP | Not support. | No                   | 0       |
| 23    | Bus Power / Clock Control Enable    | RsvdP | Not support. | No                   | 0       |

### 9.3.34 DATA REGISTER– OFFSET 44h

| BIT   | FUNCTION      | TYPE | DESCRIPTION    | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|------|----------------|----------------------|---------|
| 31:24 | Data Register | RO   | Data Register. | Yes                  | 00h     |

### 9.3.35 MSI CAPABILITIES REGISTER – OFFSET 48h

| BIT   | FUNCTION                   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------|------|---|----------------------|---------|
| 7:0   | Enhanced Capabilities ID   | RO   | Read as 05h to indicate that this is message signal interrupt capability register.  | No                   | 05h     |
| 15:8  | Next Item Pointer          | RO   | Pointer points to next PCI capability structure.  | Yes                  | 68h     |
| 16    | MSI Enable                 | RW   | 0b: The function is prohibited from using MSI to request service<br>1b: The function is permitted to use MSI to request service and is prohibited from using its INTx # pin | No/Yes               | 0       |
| 19:17 | Multiple Message Capable   | RO   | Indicate the number of requested vectors.   | Yes                  | 011b    |
| 22:20 | Multiple Message Enable    | RW   | Software writes to this field to indicate the number of allocated vectors (equal to or less than the number of requested vectors.)  | No/Yes               | 000b    |
| 23    | 64-bit address capable     | RO   | 0b: The function is not capable of generating a 64-bit message address<br>1b: The function is capable of generating a 64-bit message address                                | Yes                  | 1b      |
| 24    | Pre-vector Masking Capable | RO   | 1b: the function supports MSI pre-vector masking.<br>0b: the function does Not support MSI pre-vector masking.  | Yes                  | 1b      |
| 31:25 | Reserved                   | RO   | Not support.  | No                   | 00h     |

### 9.3.36 MESSAGE ADDRESS REGISTER – OFFSET 4Ch

| BIT  | FUNCTION        | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------|-------|---|----------------------|---------|
| 1:0  | Reserved        | RsvdP | Not support.  | No                   | 00b     |
| 31:2 | Message Address | RW    | If the message enable bit is set, the contents of this register specify the DWORD aligned address for MSI memory write transaction. | No/Yes               | 0-0h    |

### 9.3.37 MESSAGE UPPER ADDRESS REGISTER – OFFSET 50h

| BIT  | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------------------|------|---|----------------------|------------|
| 31:0 | Message Upper Address | RW   | This register is only effective if the device supports a 64-bit message address is set. | No/Yes               | 0000_0000h |

### 9.3.38 MESSAGE DATA REGISTER – OFFSET 54h

| BIT  | FUNCTION     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--------------|------|---------------|----------------------|---------|
| 15:0 | Message Data | RW   | Message data. | No/Yes               | 0000h   |

### 9.3.39 MESSAGE MASK REGISTER – OFFSET 58h

| BIT  | FUNCTION                    | TYPE  | DESCRIPTION                             | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|-----------------------------|-------|---|----------------------|-----------|
| 0    | MSI Mask for Hot Plug       | RW    | MSI mask for Hot Plug interrupts.       | No/Yes               | 0         |
| 1    | MSI Mask for DPC            | RW    | MSI mask for DPC interrupts.            | No/Yes               | 0         |
| 2    | MSI Mask for DMA and GPIO   | RW    | MSI mask for DMAGPIO interrupts.        | No/Yes               | 0         |
| 3    | MSI Mask for CDEP           | RW    | MSI mask for CDEP interrupts.           | No/Yes               | 0         |
| 4    | Reserved                    | RsvdP | Not support.                            | No                   | 0         |
| 5    | MSI Mask for thermal sensor | RW    | MSI mask for thermal sensor interrupts. | No/Yes               | 0         |
| 7:6  | Reserved                    | RW    | Not support.                            | No                   | 00        |
| 31:8 | Reserved                    | RsvdP | Not support.                            | No                   | 0000_000h |

### 9.3.40 MESSAGE PENDING REGISTER – OFFSET 5Ch

| BIT  | FUNCTION                                  | TYPE  | DESCRIPTION                                       | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|---|-------|---|----------------------|-----------|
| 0    | MSI Pending for Hot Plug Interrupts       | RO    | MSI pending status for Hot Plug interrupts.       | No                   | 0         |
| 1    | MSI Pending for DPC Interrupts            | RO    | MSI pending status for DPC interrupts.            | No                   | 0         |
| 2    | MSI Pending for GPIO Interrupts           | RO    | MSI pending status for GPIO interrupts.           | No                   | 0         |
| 3    | MSI Pending for CDEP Interrupts           | RO    | MSI pending status for CDEP interrupts.           | No                   | 0         |
| 4    | Reserved                                  | RsvdP | Not support.                                      | No                   | 0         |
| 5    | MSI Pending for thermal sensor Interrupts | RO    | MSI pending status for thermal sensor interrupts. | No                   | 0         |
| 31:6 | Reserved                                  | RsvdP | Not support.                                      | No                   | 0000_000h |

### 9.3.41 PCI EXPRESS CAPABILITIES REGISTER – OFFSET 68h

| BIT   | FUNCTION                 | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT                  |
|-------|--------------------------|-------|--|----------------------|--------------------------|
| 7:0   | Enhanced Capabilities ID | RO    | Read as 10h to indicate that this is PCI express capability register.  | No                   | 10h                      |
| 15:8  | Next Item Pointer        | RO    | Point to next PCI capability structure.  | Yes                  | A4h                      |
| 19:16 | Capability Version       | RO    | Read as 2h to indicate the device is compliant to Revision .2.0 of <i>PCI Express Base Specifications</i> .  | Yes                  | 2h                       |
| 23:20 | Device/Port Type         | RO    | Indicates the type of PCI Express logical device.  | Yes                  | 5h for Up<br>6h for Down |
| 24    | Slot Implemented         | RO    | Valid for downstream ports only.<br>When set, indicates that the PCIe Link associated with this Port is connected to a slot. This field is valid for downstream ports of the Switch. | Yes                  | 0 for Up<br>1 for Down   |
| 29:25 | Interrupt Message Number | RO    | Read as 0. No MSI messages are generated in the transparent mode.  | No                   | 00_000b                  |
| 31:30 | Reserved                 | RsvdP | Not support.   | No                   | 00b                      |

### 9.3.42 DEVICE CAPABILITIES REGISTER – OFFSET 6Ch

| BIT   | FUNCTION                        | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------------|-------|---|----------------------|---------|
| 2:0   | Max_Payload_Size Supported      | RO    | Indicates the maximum payload size that the device can support for TLPs. Each port of the Switch supports 512 bytes max payload size.   | Yes                  | 010b    |
| 4:3   | Phantom Functions Supported     | RO    | Indicates the support for use of unclaimed function numbers as Phantom functions. Read as 00b, since the Switch does not act as a requester.  | No                   | 00b     |
| 5     | Extended Tag Field Supported    | RO    | Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the Switch does not act as a requester.  | No                   | 0       |
| 8:6   | Reserved                        | RsvdP | Not support.  | No                   | 000b    |
| 11:9  | Reserved                        | RsvdP | Not support.  | No                   | 000b    |
| 14:12 | Reserved                        | RsvdP | Not support.  | No                   | 000b    |
| 15    | Role_Based Error Reporting      | RO    | When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN.   | Yes                  | 1       |
| 17:16 | Reserved                        | RsvdP | Not support.  | No                   | 00b     |
| 25:18 | Captured Slot Power Limit Value | RO    | It applies to Upstream Port only.<br><br>In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00h. | No                   | 00h     |
| 27:26 | Captured Slot Power Limit Scale | RO    | It applies to Upstream Port only.<br><br>Specifies the scale used for the Slot Power Limit Value.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00b.   | No                   | 00b     |
| 31:28 | Reserved                        | RsvdP | Not support.  | No                   | 0h      |

### 9.3.43 DEVICE CONTROL REGISTER – OFFSET 70h

| BIT | FUNCTION                             | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------------------------|-------|--|----------------------|---------|
| 0   | Correctable Error Reporting Enable   | RW    | 0b: Disable Correctable Error Reporting<br>1b: Enable Correctable Error Reporting  | No/Yes               | 0       |
| 1   | Non-Fatal Error Reporting Enable     | RW    | 0b: Disable Non-Fatal Error Reporting<br>1b: Enable Non-Fatal Error Reporting  | No/Yes               | 0       |
| 2   | Fatal Error Reporting Enable         | RW    | 0b: Disable Fatal Error Reporting<br>1b: Enable Fatal Error Reporting  | No/Yes               | 0       |
| 3   | Unsupported Request Reporting Enable | RW    | 0b: Disable Unsupported Request Reporting<br>1b: Enable Unsupported Request Reporting  | No/Yes               | 0       |
| 4   | Enable Relaxed Ordering              | RsvdP | When set, it permits the device to set the Relaxed Ordering bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.   | No                   | 0       |
| 7:5 | Max_Payload_Size                     | RW    | This field sets maximum TLP payload size for the device. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported in the Device Capabilities register. Any value exceeding the Max_Payload_Size Supported written to this register results into clamping to the Max_Payload_Size Supported value. | No/Yes               | 000b    |
| 8   | Extended Tag Field Enable            | RsvdP | Does not apply to PCI Express Switch. Returns '0' when read.   | No                   | 0       |
| 9   | Phantom Function Enable              | RsvdP | Does not apply to PCI Express Switch. Returns '0' when read.   | No                   | 0       |
| 10  | Auxiliary (AUX) Power PM Enable      | RO    | When set, indicates that a device is enabled to draw AUX power independent of PME AUX power.   | No                   | 0       |
| 11  | Enable No Snoop                      | RsvdP | When set, it permits to set the No Snoop bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.  | No                   | 0       |

| BIT   | FUNCTION              | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|-------|---|----------------------|---------|
| 14:12 | Max_Read_Request_Size | RsvdP | This field sets the maximum Read Request size for the device as a Requester. Since the Switch does not generate read request by itself, these bits are hardwired to 000b. | No                   | 000b    |
| 15    | Reserved              | RsvdP | Not support.  | No                   | 0       |

### 9.3.44 DEVICE STATUS REGISTER – OFFSET 70h

| BIT   | FUNCTION                     | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|-------|---|----------------------|---------|
| 16    | Correctable Error Detected   | RW1C  | Asserted when correctable error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.   | No/Yes               | 0       |
| 17    | Non-Fatal Error Detected     | RW1C  | Asserted when non-fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.     | No/Yes               | 0       |
| 18    | Fatal Error Detected         | RW1C  | Asserted when fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.         | No/Yes               | 0       |
| 19    | Unsupported Request Detected | RW1C  | Asserted when unsupported request is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. | No/Yes               | 0       |
| 20    | AUX Power Detected           | RO    | Asserted when the AUX power is detected by the Switch   | No                   | 0       |
| 21    | Transactions Pending         | RO    | Each port of Switch does not issue Non-posted Requests on its own behalf, so this bit is hardwired to 0b.   | No                   | 0       |
| 31:22 | Reserved                     | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.45 LINK CAPABILITIES REGISTER – OFFSET 74h

| 31:15 | Reserved                        | RsvdP | Not support.   | No                   | 0-0h    |

### 9.3.73 CORRECTABLE ERROR MASK REGISTER – OFFSET 114h

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------|-------|---|----------------------|---------|
| 0     | Receiver Error Mask           | RW    | When set, the Receiver Error event is not logged in the Header Log register and not issued as an Error Message to RC either.                | Yes                  | 0       |
| 5:1   | Reserved                      | RsvdP | Not support.  | No                   | 0_000b  |
| 6     | Bad TLP Mask                  | RW    | When set, the event of Bad TLP has been received is not logged in the Header Log register and not issued as an Error Message to RC either.  | Yes                  | 0       |
| 7     | Bad DLLP Mask                 | RW    | When set, the event of Bad DLLP has been received is not logged in the Header Log register and not issued as an Error Message to RC either. | Yes                  | 0       |
| 8     | REPLAY_NUM Rollover Mask      | RW    | When set, the REPLAY_NUM Rollover event is not logged in the Header Log register and not issued as an Error Message to RC either.           | Yes                  | 0       |
| 11:9  | Reserved                      | RsvdP | Not support.  | No                   | 000b    |
| 12    | Replay Timer Timeout Mask     | RW    | When set, the Replay Timer Timeout event is not logged in the Header Log register and not issued as an Error Message to RC either.          | Yes                  | 0       |
| 13    | Advisory Non-Fatal Error Mask | RW    | When set, the Advisory Non-Fatal Error event is not logged in the Header Long register and not issued as an Error Message to RC either.     | Yes                  | 1       |
| 14    | Corrected Internal Error Mask | RW    | When set, the corrected internal error event is not logged in the Header Log register and not issued as an Error Message to RC either.      | Yes                  | 1       |
| 31:15 | Reserved                      | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.74 ADVANCE ERROR CAPABILITIES AND CONTROL REGISTER – OFFSET 118h

| BIT  | FUNCTION                | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-------------------------|-------|---|----------------------|---------|
| 4:0  | First Error Pointer     | RO    | It indicates the bit position of the first error reported in the Uncorrectable Error Status register. | No                   | 0_0000b |
| 5    | ECRC Generation Capable | RO    | When set, it indicates the Switch has the capability to generate ECRC.                                | Yes                  | 1       |
| 6    | ECRC Generation Enable  | RW    | When set, it enables the generation of ECRC when needed.  | Yes                  | 0       |
| 7    | ECRC Check Capable      | RO    | When set, it indicates the Switch has the capability to check ECRC.                                   | Yes                  | 1       |
| 8    | ECRC Check Enable       | RW    | When set, the function of checking ECRC is enabled..  | Yes                  | 0       |
| 31:9 | Reserved                | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.75 HEADER LOG REGISTER – OFFSET From 11Ch to 128h

| BIT    | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|--------|-----------------------|------|---|----------------------|------------|
| 31:0   | 1 <sup>st</sup> DWORD | RO   | Hold the 1st DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |
| 63:32  | 2 <sup>nd</sup> DWORD | RO   | Hold the 2nd DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |
| 95:64  | 3 <sup>rd</sup> DWORD | RO   | Hold the 3rd DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |
| 127:96 | 4 <sup>th</sup> DWORD | RO   | Hold the 4th DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |

### 9.3.76 PCI EXPRESS VIRTUAL CHANNEL ENHANCED CAPABILITY REGISTER – OFFSET 130h

| BIT   | FUNCTION                 | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|------|--|----------------------|---------|
| 15:0  | Extended Capabilities ID | RO   | Read as 02h to indicate that this is PCI express extended capability register for virtual channel. | No                   | 02h     |
| 19:16 | Capability Version       | RO   | Read as 1h.  | No                   | 01h     |
| 31:20 | Next Capability Offset   | RO   | Point to next PCI extended capability structure.   | Yes                  | 1A0h    |

### 9.3.77 PORT VC CAPABILITY REGISTER 1 – OFFSET 134h

| BIT   | FUNCTION                          | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------------|-------|---|----------------------|---------|
| 2:0   | Extended VC Count                 | RO    | It indicates the number of extended Virtual Channels in addition to the default VC supported by the Switch.   | No                   | 000b    |
| 3     | Reserved                          | RO    | Not support.  | No                   | 0       |
| 6:4   | Low Priority Extended VC Count    | RO    | It indicates the number of extended Virtual Channels in addition to the default VC belonging to the low-priority VC (LPVC) group.                       | No                   | 000b    |
| 7     | Reserved                          | RO    | Not support.  | No                   | 0       |
| 9:8   | Reference Clock                   | RO    | It indicates the reference clock for Virtual Channels that support time-based WRR Port Arbitration. Defined encoding is 00b for 100 ns reference clock. | No                   | 00b     |
| 11:10 | Port Arbitration Table Entry Size | RO    | Read as 10b to indicate the size of Port Arbitration table entry in the device is 4 bits.   | No                   | 10b     |
| 31:12 | Reserved                          | RsvdP | Not support.  | No                   | 0000_0h |

### 9.3.78 PORT VC CAPABILITY REGISTER 2 – OFFSET 138h

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|---|----------------------|---------|
| 7:0   | VC Arbitration Capability   | RO    | It indicates the types of VC Arbitration supported by the device for the LPVC group. This field is valid when LPVC is greater than 0. The Switch supports Hardware fixed arbitration scheme, e.g., Round Robin and Weight Round Robin arbitration with 32 phases in LPVC. | No                   | 00h     |
| 23:8  | Reserved                    | RsvdP | Not support.  | No                   | 0000h   |
| 31:24 | VC Arbitration Table Offset | RO    | It indicates the location of the VC Arbitration Table as an offset from the base address of the Virtual Channel Capability register in the unit of DQWD (16 bytes).   | No                   | 00h     |

### 9.3.79 PORT VC CONTROL REGISTER – OFFSET 13Ch

| BIT | FUNCTION                  | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|---------------------------|------|---|----------------------|---------|
| 0   | Load VC Arbitration Table | WO   | When set, the programmed VC Arbitration Table is applied to the hardware. This bit always returns 0b when read. | Yes                  | 0       |

| BIT  | FUNCTION              | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------------|-------|--|----------------------|---------|
| 3:1  | VC Arbitration Select | RW    | This field is used to configure the VC Arbitration by selecting one of the supported VC Arbitration schemes. The valid values for the schemes supported by Switch are 0b and 1b. Other value than these written into this register will be treated as default. | No/Yes               | 000b    |
| 15:4 | Reserved              | RsvdP | Not support.   | No                   | 000h    |

### 9.3.80 PORT VC STATUS REGISTER – OFFSET 13Ch

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|---|----------------------|---------|
| 16    | VC Arbitration Table Status | RO    | When set, it indicates that any entry of the VC Arbitration Table is written by software. This bit is cleared when hardware finishes loading values stored in the VC Arbitration Table after the bit of “Load VC Arbitration Table” is set. | No                   | 0       |
| 31:17 | Reserved                    | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.81 VC RESOURCE CAPABILITY REGISTER (0) – OFFSET 140h

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|-------------------------------|-------|---|----------------------|----------|
| 7:0   | Port Arbitration Capability   | RO    | It indicates the types of Port Arbitration supported by the VC resource. The Switch supports Round Robin Hardware fixed arbitration scheme.                               | No                   | 01h      |
| 13:8  | Reserved                      | RsvdP | Not support.  | No                   | 00_0000h |
| 14    | Advanced Packet Switching     | RO    | When set, it indicates the VC resource only supports transaction optimized for Advanced Packet Switching (AS).  | No                   | 0        |
| 15    | Reject Snoop Transactions     | RsvdP | Not support.  | No                   | 0        |
| 22:16 | Maximum Time Slots            | RO    | It indicates the maximum numbers of time slots (minus one) are allocated for Isochronous traffic.   | No                   | 3Fh      |
| 23    | Reserved                      | RsvdP | Not support.  | No                   | 0        |
| 31:24 | Port Arbitration Table Offset | RO    | It indicates the location of the Port Arbitration Table (n) as an offset from the base address of the Virtual Channel Capability register in the unit of DQWD (16 bytes). | No                   | 05h      |

### 9.3.82 VC RESOURCE CONTROL REGISTER (0) – OFFSET 144h

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|--|----------------------|---------|
| 7:0   | TC/VC Map                   | RW    | This field indicates the TCs that are mapped to the VC resource. Bit locations within this field correspond to TC values. When the bits in this field are set, it means that the corresponding TCs are mapped to the VC resource. Bit 0 of this field is read-only and must be set to “1” for the VC0. | No/Yes               | FFh     |
| 15:8  | Reserved                    | RsvdP | Not support.   | No                   | 00h     |
| 16    | Load Port Arbitration Table | RW    | When set, the programmed Port Arbitration Table is applied to the hardware. This bit always returns 0b when read.  | No/Yes               | 0       |
| 19:17 | Port Arbitration Select     | RW    | This field is used to configure the Port Arbitration by selecting one of the supported Port Arbitration schemes. The permissible values for the schemes supported by Switch are 000b and 011b at VC0, other value than these written into this register will be treated as default.                    | No/Yes               | 000b    |
| 23:20 | Reserved                    | RsvdP | Not support.   | No                   | 0h      |
| 26:24 | VC ID                       | RO    | This field assigns a VC ID to the VC resource.   | No                   | 000b    |
| 30:27 | Reserved                    | RsvdP | Not support.   | No                   | 0h      |
| 31    | VC Enable                   | RW    | 0b: it disables this Virtual Channel<br>1b: it enables this Virtual Channel  | No/Yes               | 1       |

### 9.3.83 VC RESOURCE STATUS REGISTER (0) – OFFSET 148h

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------|-------|---|----------------------|---------|
| 15:0  | Reserved                      | RsvdP | Not support.  | No                   | 0000h   |
| 16    | Port Arbitration Table Status | RO    | When set, it indicates that any entry of the Port Arbitration Table is written by software. This bit is cleared when hardware finishes loading values stored in the Port Arbitration Table after the bit of “Load Port Arbitration Table” is set. | No                   | 0       |
| 17    | VC Negotiation Pending        | RO    | When set, it indicates that the VC resource is still in the process of negotiation. This bit is cleared after the VC negotiation is complete.   | No                   | 1       |
| 31:18 | Reserved                      | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.84 DEVICE SERIAL NUMBER ENHANCED CAPABILITY HEADER REGISTER – OFFSET 1A0h

| BIT   | FUNCTION                 | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT                      |
|-------|--------------------------|------|---|----------------------|------------------------------|
| 15:0  | Extended Capabilities ID | RO   | Read as 0003h to indicate that this is PCI express extended capability register for device serial number. | No                   | 0003h                        |
| 19:16 | Capability Version       | RO   | Must be 1h for this version.  | No                   | 1h                           |
| 31:20 | Next Capability Offset   | RO   | Point to next PCI extended capability structure.  | Yes                  | 1B0h for Up<br>1C0h for Down |

### 9.3.85 DEVICE SERIAL NUMBER LOWER DW REGISTER – OFFSET 1A4h

| BIT  | FUNCTION                                | TYPE | DESCRIPTION                           | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---|------|---------------------------------------|----------------------|------------|
| 31:0 | Device serial number 1 <sup>st</sup> DW | RO   | First dword for device serial number. | Yes                  | 0000_12D8h |

### 9.3.86 DEVICE SERIAL NUMBER HIGHER DW REGISTER – OFFSET 1A8h

| BIT  | FUNCTION                                | TYPE | DESCRIPTION                                     | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---|------|---|----------------------|------------|
| 31:0 | Device serial number 2 <sup>nd</sup> DW | RO   | 2 <sup>nd</sup> dword for device serial number. | Yes                  | 0816_4896h |

### 9.3.87 PCI EXPRESS POWER BUDGETING ENHANCED CAPABILITY HEADER REGISTER – OFFSET 1B0h (Upstream Port Only)

| BIT   | FUNCTION                 | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|------|--|----------------------|---------|
| 15:0  | Extended Capabilities ID | RO   | Read as 0004h to indicate that this is PCI express extended capability register for power budgeting. | No                   | 0004h   |
| 19:16 | Capability Version       | RO   | Must be 1h for this version.   | No                   | 01h     |
| 31:20 | Next Capability Offset   | RO   | Point to next PCI extended capability structure.   | Yes                  | 1D0h    |

### 9.3.88 DATA SELECT REGISTER – OFFSET 1B4h (Upstream Port Only)

| BIT  | FUNCTION       | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------------|-------|---|----------------------|---------|
| 7:0  | Data Selection | RW    | It indexes the power budgeting data reported through the data register.<br><br>When 00h, it selects D0 Max power budget<br>When 01h, it selects D0 Sustained power budget<br>Other values would return zero power budgets, which means Not supported. | No/Yes               | 00h     |
| 31:8 | Reserved       | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.89 POWER BUDGETING DATA REGISTER – OFFSET 1B8h (Upstream Port Only)

| BIT   | FUNCTION     | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|--------------|-------|--|----------------------|--|
| 7:0   | Base Power   | RO    | It specifies the base power value in watts. This value represents the required power budget in the given operation condition.                            | Yes                  | 04h if<br><a href="#">13Ch.bit[0]=0</a><br>03h if<br><a href="#">13Ch.bit[0]=1</a> |
| 9:8   | Data Scale   | RO    | It specifies the scale to apply to the base power value.   | Yes                  | 00b  |
| 12:10 | PM Sub State | RO    | It specifies the power management sub state of the given operation condition. It is initialized to the default sub state.                                | Yes                  | 000b   |
| 14:13 | PM State     | RO    | It specifies the power management state of the given operation condition. It defaults to the D0 power state.   | Yes                  | 00b  |
| 17:15 | Type         | RO    | It specifies the type of the given operation condition which is controlled by offset <a href="#">13Ch[7:0]</a> . It defaults to the Maximum power state. | Yes                  | 7h if<br><a href="#">13Ch.bit[0]=0</a><br>3h if<br><a href="#">13Ch.bit[0]=1</a>   |
| 20:18 | Power Rail   | RO    | It specifies the power rail of the given operation condition.  | Yes                  | 010b   |
| 31:21 | Reserved     | RsvdP | Not support.   | No                   | 0-0h   |

### 9.3.90 POWER BUDGET CAPABILITY REGISTER – OFFSET 1BCh (Upstream Port Only)

| BIT  | FUNCTION         | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|------------------|-------|---|----------------------|---------|
| 0    | System Allocated | RO    | When set, it indicates that the power budget for the device is included within the system power budget. | Yes                  | 1       |
| 31:1 | Reserved         | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.91 ACS ENHANCED CAPABILITY HEADER REGISTER – OFFSET 1C0h (Downstream Port Only)

| BIT   | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|------|--|----------------------|---------|
| 15:0  | PCI Express Extended Capability ID | RO   | Read as 000Dh to indicate that this is PCI Express Extended Capability register for ACS. | No                   | 000Dh   |
| 19:16 | Capability Version                 | RO   | Must be 1h for this version.   | No                   | 1h      |
| 31:20 | Next Capability ID                 | RO   | Point to next PCI extended capability structure.   | Yes                  | 1D0h    |

### 9.3.92 ACS CAPABILITY REGISTER – OFFSET 1C4h (Downstream Port Only)

| BIT | FUNCTION                 | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------------|------|---|----------------------|---------|
| 0   | ACS Source Validation    | RO   | Indicated the implements of ACS Source Validation.    | Yes                  | 1       |
| 1   | ACS Translation Blocking | RO   | Indicated the implements of ACS Translation Blocking. | Yes                  | 1       |

| BIT   | FUNCTION                           | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|-------|--|----------------------|---------|
| 2     | ACS P2P Request Redirect           | RO    | Indicated the implements of ACS P2P Request Redirect.  | Yes                  | 1       |
| 3     | ACS P2P Completion Redirect        | RO    | Indicated the implements of ACS P2P Completion Redirect  | Yes                  | 1       |
| 4     | ACS Upstream Forwarding            | RO    | Indicated the implements of ACS Upstream Forwarding.   | Yes                  | 1       |
| 5     | ACS P2P Egress control             | RO    | Indicated the implements of ACS P2P Egress control.  | Yes                  | 1       |
| 6     | ACS Direct Translated P2P          | RO    | Indicated the implements of ACS Direct Translated P2P.   | Yes                  | 1       |
| 7     | Reserved                           | RsvdP | Not support.   | No                   | 0       |
| 15:8  | Egress Control Vector Size         | RO    | Encodings 01h – FFh directly indicate the number of applicable bits in theEgress Control Vector. | Yes                  | 10h     |
| 16    | ACS Source Validation Enable       | RW    | Enable the source validation.  | No/Yes               | 0       |
| 17    | ACS Translation Blocking Enable    | RW    | Enable ACS Translation Blocking.   | No/Yes               | 0       |
| 18    | ACS P2P Request Redirect           | RW    | Enable ACS P2P Request Redirect.   | No/Yes               | 0       |
| 19    | ACS P2P Completion Redirect Enable | RW    | Enable ACS P2P Completion Redirect.  | No/Yes               | 0       |
| 20    | ACS Upstream Forwarding Enable     | RW    | Enable ACS Upstream Forwarding.  | No/Yes               | 0       |
| 21    | ACS P2P Egress control Enable      | RW    | Enable ACS P2P Egress control.   | No/Yes               | 0       |
| 22    | ACS Direct Translated P2P Enable   | RW    | Enable ACS Direct Translated P2P.  | No/Yes               | 0       |
| 31:23 | Reserved                           | RsvdP | Not support.   | No                   | 00h     |

### 9.3.93 EGRESS CONTROL VECTOR REGISTER – OFFSET 1C8h (Downstream Port Only)

| BIT   | FUNCTION              | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|-------|---|----------------------|---------|
| 15:0  | Egress Control Vector | RW    | When a given bit is set, peer-to-peer requests targeting the associated Port are blocked or redirected. | No/Yes               | 0000h   |
| 31:16 | Reserved              | RsvdP | Not support.  | No                   | 0000h   |

### 9.3.94 MULTI-CAST ENHANCED CAPABILITY HEADER REGISTER – OFFSET 1D0h

| BIT   | FUNCTION                 | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|--------------------------|------|---|----------------------|--|
| 15:0  | Extended Capabilities ID | RO   | Read as 0012h to indicate that this is PCI express extended capability register for multi-cast. | No                   | 0012h  |
| 19:16 | Capability Version       | RO   | Read as 1h.   | No                   | 1h   |
| 31:20 | Next Capability Offset   | RO   | Point to next PCI extended capability structure.  | Yes                  | 210h if <a href="#">8Ch.bit[11]=0</a><br>200h if <a href="#">8Ch.bit[11]=1</a> |

### 9.3.95 MULTI-CAST CAPABILITY REGISTER – OFFSET 1D4h

| BIT  | FUNCTION                       | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|------|--------------------------------|------|--|----------------------|----------|
| 5:0  | MC_Max_Group                   | RO   | Value indicates the max. number of Multicast Groups that the component supports. | No                   | 11_1111b |
| 14:6 | Reserved                       | RO   | Not support.   | No                   | 0        |
| 15   | MC_ECRC_Regeneration_Supported | RO   | If set, indicates that ECRC regeneration is supported.                           | No                   | 0        |

### 9.3.96 MULTI-CAST CONTROL REGISTER – OFFSET 1D4h

| BIT   | FUNCTION     | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|--------------|-------|--|----------------------|----------|
| 21:16 | MC_Num_Group | RW    | Value indicates the number of Multicast Groups configured for use. | No/Yes               | 00_0000b |
| 30:22 | Reserved     | RsvdP | Not support.   | No                   | 0-0h     |
| 31    | MC_Enable    | RW    | When set, the Multicast mechanism is enabled for the component.    | No/Yes               | 0        |

### 9.3.97 MULTI-CAST BASE ADDRESS 0 REGISTER – OFFSET 1D8h

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------|-------|---|----------------------|---------|
| 5:0   | MC_Index_Position          | RW    | The location of the LSB of the Multicast Group number within the address. | No/Yes               | 00h     |
| 11:6  | Reserved                   | RsvdP | Not support.  | No                   | 00h     |
| 31:12 | MC_Base_Address<br>[31:12] | RW    | The base address of the Multicast address range.                          | No/Yes               | 0-0h    |

### 9.3.98 MULTI-CAST BASE ADDRESS 1 REGISTER – OFFSET 1DCh

| BIT  | FUNCTION                   | TYPE | DESCRIPTION                                      | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|----------------------------|------|--|----------------------|------------|
| 31:0 | MC_Base_Address<br>[63:32] | RW   | The base address of the Multicast address range. | No/Yes               | 0000-0000h |

### 9.3.99 MULTI-CAST RECEIVER REGISTER – OFFSET 1E0h

| BIT  | FUNCTION         | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------------|------|--|----------------------|------------|
| 31:0 | MC_Receive[31:0] | RW   | For each bit that's set, this Function gets a copy of any Multicast TLPs for the associated Multicast Group. | No/Yes               | 0000_0000h |

### 9.3.100 MULTI-CAST RECEIVER UPPER 32-BITS REGISTER – OFFSET 1E4h

| BIT  | FUNCTION          | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-------------------|------|--|----------------------|------------|
| 31:0 | MC_Receive[63:32] | RW   | For each bit that's set, this Function gets a copy of any Multicast TLPs for the associated Multicast Group. | No/Yes               | 0000_0000h |

### 9.3.101 MULTI-CAST BLOCK ALL REGISTER – OFFSET 1E8h

| BIT  | FUNCTION           | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------------|------|---|----------------------|------------|
| 31:0 | MC_Block_All[31:0] | RW   | For each bit that is set, this Function is blocked from sending TLPs to the associated Multicast Group. | No/Yes               | 0000_0000h |

### 9.3.102 MULTI-CAST BLOCK ALL UPPER 32-BITS REGISTER – OFFSET 1ECh

| BIT  | FUNCTION            | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---------------------|------|---|----------------------|------------|
| 31:0 | MC_Block_All[63:32] | RW   | For each bit that is set, this Function is blocked from sending TLPs to the associated Multicast Group. | No/Yes               | 0000_0000h |

### 9.3.103 MULTI-CAST BLOCK UNTRANSLATED REGISTER – OFFSET 1F0h

| BIT  | FUNCTION                    | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------------------------|------|---|----------------------|------------|
| 31:0 | MC_Block_Untranslated[31:0] | RW   | For each bit that is set, this Function is blocked from sending TLPs containing Untranslated Addresses to the associated MCG. | No/Yes               | 0000_0000h |

### 9.3.104 MULTI-CAST BLOCK UNTRANSLATED UPPER 32-BITS REGISTER – OFFSET 1F4h

| BIT  | FUNCTION                     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------------------------|------|---|----------------------|------------|
| 31:0 | MC_Block_Untranslated[63:32] | RW   | For each bit that is set, this Function is blocked from sending TLPs containing Untranslated Addresses to the associated MCG. | No/Yes               | 0000_0000h |

### 9.3.105 LTR EXTENDED CAPABILITY HEADER – OFFSET 200h (Upstream Port Only)

| BIT   | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|------------------------------------|------|--|----------------------|--|
| 15:0  | PCI Express Extended Capability ID | RO   | Read as 0018h to indicate that this is PCI Express Extended Capability register for LTR. | No                   | 0018h if 8Ch.bit[11]=1<br>0000h if 8Ch.bit[11]=0 |
| 19:16 | Capability Version                 | RO   | Must be 1h for this version.   | No                   | 1h if 8Ch.bit[11]=1<br>0h if 8Ch.bit[11]=0       |
| 31:20 | Next Capability ID                 | RO   | Point to next PCI extended capability structure.   | Yes                  | 210h if 8Ch.bit[11]=1<br>000h if 8Ch.bit[11]=0   |

### 9.3.106 MAX SNOOP LATENCY REGISTER – OFFSET 204h (Upstream Port Only)

| BIT   | FUNCTION                | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|-------------------------|-------|--|----------------------|--|
| 9:0   | Max Snoop Latency Value | RW    | Specifies the maximumsnoop latency that a device is permitted to request                         | No/Yes               | 0D0h if 8Ch.bit[11]=1<br>000h if 8Ch.bit[11]=0 |
| 12:10 | Max Snoop Latency Scale | RW    | This register provides a scalefor the value contained within the Maximum SnoopLatencyValue field | No/Yes               | 000b   |
| 15:13 | Reserved                | RsvdP | Not support.   | No                   | 000b   |

### 9.3.107 MAX NO-SNOOP LATENCY REGISTER – OFFSET 204h (Upstream Port Only)

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|----------------------------|-------|---|----------------------|--|
| 25:16 | Max No-Snoop Latency Value | RW    | Specifies the maximum no-snoop latency that a device is permitted to request                        | No/Yes               | 0D0h if 8Ch.bit[11]=1<br>000h if 8Ch.bit[11]=0 |
| 28:26 | Max No-Snoop Latency Scale | RW    | This register provides a scalefor the value contained within the Maximum No-SnoopLatencyValue field | No/Yes               | 000b   |
| 31:29 | Reserved                   | RsvdP | Not support.  | No                   | 000b   |

### 9.3.108 SECONDARY PCI EXPRESS EXTENDED CAPABILITY HEADER – OFFSET 210h

| BIT   | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT                      |
|-------|------------------------------------|------|--|----------------------|------------------------------|
| 15:0  | PCI Express Extended Capability ID | RO   | Read as 0019h to indicate that this is PCI Express Extended Capability register for Secondary PCI Express. | No                   | 0019h                        |
| 19:16 | Capability Version                 | RO   | Must be 1h for this version.   | No                   | 1h                           |
| 31:20 | Next Capability ID                 | RO   | Point to next PCI extended capability structure.   | Yes                  | 2B0h for Up<br>2A0h for Down |

### 9.3.109 LINK CONTROL 3 REGISTER – OFFSET 214h

| BIT | FUNCTION             | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------------|------|---|----------------------|---------|
| 0   | Perform Equalization | RW   | When this bit is 1b and a 1b is written to the Retrain Link bit with the Target Link Speed field set to 8.0 GT/s, the downstream port must perform Link Equalization. | No/Yes               | 0       |

| BIT  | FUNCTION                                   | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--|-------|--|----------------------|---------|
| 1    | Link Equalization Request Interrupt Enable | RW    | When set, this bit enables the generation of an interrupt to indicate that the Link Equalization bit has been set. | No/Yes               | 0       |
| 31:2 | Reserved                                   | RsvdP | Not support.   | No                   | 0000h   |

### 9.3.110 LANE ERROR STATUS REGISTER – OFFSET 218h

| BIT  | FUNCTION          | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-------------------|------|--|----------------------|------------|
| 31:0 | Lane Error Status | RW1C | Each bit indicates if the corresponding Lane detected a Lane-base error. | No/Yes               | 0000_0000h |

### 9.3.111 LANE EQUALIZATION CONTROL REGISTER – OFFSET 21Ch – 230h

**Table 9-2 Lane Equalization Control Register Locations**

| CFG_OFFSET | Lane Number | CFG_OFFSET | Lane Number |
|------------|-------------|------------|-------------|
| 21Ch       | 0           | 22Ch       | 8           |
| 21Eh       | 1           | 22Eh       | 9           |
| 220h       | 2           | 230h       | 10          |

DPC is enabled and is triggered when the Downstream port detects an unmasked uncorrectable error or when the Downstream port receives an ERR_NONFATAL or ERR_FATAL message<br>11b... Reserved | No/Yes               | 00b     |
| 18    | DPC Completion Control | RW    | This bit controls the Completion Status for Completions formed during DPC.<br><br>0b: Completer Abort (CA) Completion Status<br>1b: Unsupported Request (UR) Completion Status  | No/Yes               | 0       |
| 19    | DPC Interrupt Enable   | RW    | When set, this bit enables the generation of an interrupt to indicate that DPC has been triggered.  | No/Yes               | 0       |
| 20    | DPC ERR_COR Enable     | RW    | When set, this bit enables the sending of an ERR_COR message to indicate that DPC has been triggered.   | No/Yes               | 0       |
| 31:21 | Reserved               | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.115 DPC STATUS REGISTER – OFFSET 2A8h (Downstream Port Only)

| BIT  | FUNCTION             | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------------------|-------|---|----------------------|---------|
| 0    | DPC Trigger Status   | RW1C  | When set, this bit indicates that DPC has been triggered.   | No/Yes               | 0       |
| 2:1  | DPC Trigger Reason   | RW1C  | This field indicates why DPC has been triggered.<br><br>00b... DPC was triggered due to an unmasked uncorrectable error<br>01b... DPC was triggered due to receiving an ERR_NONFATAL<br>10b... DPC was triggered due to receiving an ERR_FATAL<br>11b... Reserved | No/Yes               | 00b     |
| 3    | DPC Interrupt Status | RW1C  | This bit is set if DPC is triggered while the DPC interrupt Enable bit is set.  | No/Yes               | 0       |
| 15:4 | Reserved             | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.116 DPC ERROR SOURCE ID REGISTER – OFFSET 2A8h (Downstream Port Only)

| BIT   | FUNCTION            | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------|------|---|----------------------|---------|
| 31:16 | DPC Error Source ID | RO   | When the DPC Trigger Reason field indicates that DPC was triggered due to the reception of an ERR_NONFATAL or ERR_FATAL, this register contains the Requester ID of the received message. Otherwise, the value of this register is undefined. | No                   | 0000h   |

### 9.3.117 LI PM SUBSTATES ENHANCED CAPABILITY HEADER – OFFSET 2B0h

| BIT  | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|------------------------------------|------|--|----------------------|---------|
| 15:0 | PCI Express Extended Capability ID | RO   | Read as 001Eh to indicate that this is PCI Express Extended Capability register for L1 PM Substates. | No                   | 001Eh   |

| BIT   | FUNCTION           | TYPE | DESCRIPTION                                      | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------|------|--|----------------------|---------|
| 19:16 | Capability Version | RO   | Must be 1h for this version.                     | No                   | 1h      |
| 31:20 | Next Capability ID | RO   | Point to next PCI extended capability structure. | Yes                  | 300h    |

### 9.3.118 L1 PM SUBSTATES CAPABILITY REGISTER – OFFSET 2B4h

| BIT  | FUNCTION                  | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------------------|-------|--|----------------------|---------|
| 0    | PCI-PM L1.2 Supported     | RO    | When set this bit indicates that PCI-PM L1.2 is supported.   | Yes                  | 0       |
| 1    | PCI-PM L1.1 Supported     | RO    | When set this bit indicates that PCI-PM L1.1 is supported and must be set by all ports implementing L1 PM Substates. | Yes                  | 0       |
| 3:2  | Reserved                  | RsvdP | Not support.   | No                   | 00b     |
| 4    | L1 PM Substates Supported | RO    | When set this bit indicates that this port supports L1 PM Substates.   | Yes                  | 1       |
| 31:5 | Reserved                  | RsvdP | Not support.   | No                   | 0-0h    |

### 9.3.119 L1 PM SUBSTATES CONTROL 1 REGISTER – OFFSET 2B8h

| BIT  | FUNCTION           | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--------------------|-------|---|----------------------|---------|
| 0    | PCI-PM L1.2 Enable | RW    | When set this bit enables PCI-PM L1.2. Required for both upstream and downstream ports. | No/Yes               | 0       |
| 1    | PCI-PM L1.1 Enable | RW    | When set this bit enables PCI-PM L1.1. Required for both upstream and downstream ports. | No/Yes               | 0       |
| 31:2 | Reserved           | RsvdP | Not support.  | No                   | 0-0h    |

### 9.3.120 L1 PM SUBSTATES CONTROL 2 REGISTER – OFFSET 2BCh

| BIT  | FUNCTION | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|----------|-------|--------------|----------------------|------------|
| 31:0 | Reserved | RsvdP | Not support. | No                   | 0000_0000h |

### 9.3.121 VENDOR-SPECIFIC ENHANCED CAPABILITY HEADER – OFFSET 300h

| BIT   | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|------|--|----------------------|---------|
| 15:0  | PCI Express Extended Capability ID | RO   | Read as 000Bh to indicate that this is PCI Express Extended Capability register for Vendor-Specific. | No                   | 000Bh   |
| 19:16 | Capability Version                 | RO   | Must be 1h for this version.   | No                   | 1h      |
| 31:20 | Next Capability ID                 | RO   | Points to 000h.  | No                   | 000h    |

### 9.3.122 VENDOR-SPECIFIC HEADER – OFFSET 304h

| BIT   | FUNCTION    | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------|------|--|----------------------|---------|
| 15:0  | VSEC ID     | RO   | This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. | Yes                  | 0000h   |
| 19:16 | VSEC Rev    | RO   | This field is a vendor-defined version number that indicates the version of the VSEC structure.      | No                   | 0h      |
| 31:20 | VSEC Length | RO   | This field indicates the number of bytes in the entire VSEC structure.                               | Yes                  | 560h    |

### 9.3.123 EEPROM CONTROL REGISTER – OFFSET 308h (Upstream Port Only)

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------|-------|---|----------------------|---------|
| 0     | EEPROM Start                  | RW    | Starts the EEPROM read or write cycle. This bit will auto Clear to 0 when access is completed.<br>1b: start read or write cycle   | Yes                  | 0       |
| 3:1   | Reserved                      | RsvdP | Not support.  | No                   | 000b    |
| 4     | EEPROM Autoload Status        | RO    | 0b: EEPROM autoload is unsuccessful or is disabled<br>1b: EEPROM autoload is successful after PERST_L.  | No                   | 0       |
| 5     | EEPROM is in programming mode | RO    | 0b: EEPROM is in auto-load mode<br>1b: EEPROM is in programming mode  | Yes                  | 1       |
| 7:6   | EEPROM Clock Rate             | RW    | Determines the frequency of the EEPROM clock which is derived from the primary clock.<br>00b: 500MHz/128<br>01b: 500MHz/(128*2)<br>10b: 500MHz/(128*4)<br>11b: 500MHz/(128*8)               | Yes                  | 00b     |
| 15:8  | EEPROM Status                 | RO    | Indicates the EEPROM status reflected by EEPROM read command.   | No                   | 00h     |
| 23:16 | EEPROM Command                | RW    | 01h: write STATUS register<br>02h: EEPROM write<br>03h: EEPROM read<br>04h: disable write operation<br>05h: read STATUS register<br>06h: enable write operation<br>C7h: erase entire EEPROM | Yes                  | 00h     |
| 30:24 | Reserved                      | RsvdP | Not support.  | No                   | 00h     |
| 31    | Size 64K Mode                 | RW    | 0b: EEPROM size is less or equal to 64K<br>1b: EEPROM size is larger 64K  | Yes                  | 0       |

### 9.3.124 EEPROM ADDRESS AND DATA REGISTER – OFFSET 30Ch (Upstream Port Only)

| BIT   | FUNCTION       | TYPE | DESCRIPTION                  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------|------|------------------------------|----------------------|---------|
| 15:0  | EEPROM Address | RW   | Contains the EEPROM address. | Yes                  | 0000h   |
| 31:16 | EEPROM Data    | RW   | Contains the EEPROM data.    | Yes                  | 0000h   |

### 9.3.125 DEBUGOUT CONTROL REGISTER – OFFSET 310h (Port 0 Only)

| BIT   | FUNCTION             | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------|-------|--|----------------------|---------|
| 4:0   | Debug Mode Select    | RW    | Debug mode select. Selects a signal group for probing the current internal status. For example, “0” represents LTSSM signal group. As to other values, please inquire internal team for further information. | Yes                  | 0_0000b |
| 7:5   | Debug Port Select_S1 | RW    | Debug port select s1. Selects a port number for monitoring at a given signal group.  | Yes                  | 000b    |
| 8     | DebugPort Select_S2  | RW    | Debugport select s2.   | Yes                  | 0       |
| 9     | Debug Output Start   | RW    | Start to capture debug output data.  | Yes                  | 0       |
| 31:10 | Reserved             | RsvdP | Not support.   | No                   | 0-0h    |

### 9.3.126 DEBUGOUT DATA REGISTER – OFFSET 314h (Port 0 Only)

| BIT | FUNCTION          | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-------------------|------|---|----------------------|---------|
| 9:0 | Debug Output Data | RO   | Content of the debug output data.<br>For example, if LTSSM signal group is selected, the meaning of | No                   | 000h    |

| BIT   | FUNCTION | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------|-------|--|----------------------|---------|
|       |          |       | debug output data is as follows.<br><br>001h: detect<br>002h: polling<br>004h: configuration<br>008h: L0<br>010h: L1<br>020h: L2<br>040h: disable<br>080h: hot-reset<br>100h: loopback<br>200h: recovery<br>Others: Reserved |                      |         |
| 31:10 | Reserved | RsvdP | Not support  | No                   | 0000_0h |

### 9.3.127 SMBUS CONTROL AND STATUS REGISTER – OFFSET 318h (Port 0 Only)

| BIT   | FUNCTION                  | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT                                     |

### 9.3.261 TRIGGER POSITION SELECT REGISTER – OFFSET 724h (Port 0 Only)

| BIT  | FUNCTION                | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-------------------------|-------|---|----------------------|---------|
| 6:0  | Trigger Position Select | RW    | Used to select the trigger address, where 00h is from header (0%) and 7Fh is ending (100%). | Yes                  | 20h     |
| 31:7 | Reserved                | RsvdP | Not support.  | No                   | 0_0h    |

### 9.3.262 TRIGGER COUNTER SETTING REGISTER – OFFSET 72Ch (Port 0 Only)

| BIT  | FUNCTION | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|----------|-------|---|----------------------|-----------|
| 3:0  | Counter  | RW    | Used to set trigger amount when trigger achieves the trigger count. | Yes                  | 0h        |
| 31:4 | Reserved | RsvdP | Not support.  | No                   | 0000_000h |

### 9.3.263 TRIGGER START REGISTER – OFFSET 730h (Port 0 Only)

| BIT   | FUNCTION           | TYPE  | DESCRIPTION                       | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------|-------|-----------------------------------|----------------------|---------|
| 0     | Trigger Start      | RW    | When set, start the trigger.      | Yes                  | 0       |
| 1     | Debug_to_use_LA_en | RW    | When set, enable debug to use LA. | Yes                  | 0       |
| 15:2  | Reserved           | RsvdP | Not support.                      | No                   | 0-0b    |
| 29:16 | Cycle Left         | RO    | Show how many cycles left.        | No                   | 3FFFh   |
| 31:30 | Reserved           | RsvdP | Not support.                      | No                   | 00b     |

### 9.3.264 READ WAVEFORM DATA REGISTER – OFFSET 734h (Port 0 Only)

| BIT  | FUNCTION           | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------------|------|---|----------------------|------------|
| 31:0 | Read Waveform Data | RO   | Used to output embedded debug memory data.<br><br>Total 4096 cycles can be read and read out is in sequence from cycle 0. Each offset 734h read command will advance 1 cycle automatically. | No                   | 0000_0000h |

### 9.3.265 SAMPLE RATE SETTING REGISTER – OFFSET 738h (Port 0 Only)

| BIT  | FUNCTION            | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---------------------|-------|---|----------------------|------------|
| 3:0  | Sample Rate Setting | RW    | Used to set the embedded LA sampling rate.<br>0h: 500MHz sampling rate<br>1h: 250MHz sampling rate<br>2h: 125MHz sampling rate<br>... | Yes                  | 0000_0000h |
| 31:4 | Reserved            | RsvdP | Not support.  | No                   | 0-0h       |

### 9.3.266 WAVEFORM OUTPUT PORT SELECT REGISTER – OFFSET 73Ch (Port 0 Only)

| BIT   | FUNCTION                         | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|----------------------------------|-------|--|----------------------|----------|
| 5:0   | Waveform Output Port Select      | RW    | Used to select which port's debug_out[31:0] can be dumped into embedded debug memory.  | Yes                  | 00_0000b |
| 7:6   | Reserved                         | RsvdP | Not support.   | No                   | 00b      |
| 12:8  | Waveform Output Model_Sel Select | RW    | Used to select which model_sel[4:0] debug_out can be dumped into embedded debug memory.  | Yes                  | 0-0b     |
| 15:13 | Reserved                         | RsvdP | Not support.   | No                   | 000b     |
| 16    | Switch Output Singal Source      | RW    | When set, it will switch debug_mode GPIO[31:0] output signal source from internal debug_out to debug memory stored debug_out data. | Yes                  | 0        |
| 17    | Enable User-Defined Mode         | RW    | When set, it will select internal debug_out port_sel/mode_sel to bit[5:0]/bit[12:8] port_sel/mode_sel value.                       | Yes                  | 0        |
| 18    | PORT_GOOD Setting                | RW    | When set, it will switch PORT_GOOD_L[7:0] output from original link status to internal error status.                               | Yes                  | 0        |
| 31:19 | Reserved                         | RsvdP | Not support.   | No                   | 0-0h     |

### 9.3.267 WAVEFORM READ EVENT RESET REGISTER – OFFSET 748h (Port 0 Only)

| BIT  | FUNCTION                          | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------------------------|-------|--|----------------------|---------|
| 0    | Back to waveform by CFG/I2C/SMBUS | WO    | When set, the read point will back to the header of the waveform.<br>Reading returns 0 always. | Yes                  | 0       |
| 31:1 | Reserved                          | RsvdP | Not support.   | No                   | 0-0h    |

### 9.3.268 DUMP MEMORY TO GPIO RATE CONTROL REGISTER – OFFSET 74Ch (Port 0 Only)

| BIT  | FUNCTION                                | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---|-------|--|----------------------|---------|
| 3:0  | Dump Waveform to LA Sample Rate Setting | RW    | Used to set the debug memory 32 bits data output to GPIO[31:0] rate.<br>0h: output to GPIO[31:0] as 500MHz clock rate<br>1h: output to GPIO[31:0] as 250MHz clock rate<br>2h: output to GPIO[31:0] as 125MHz clock rate<br>... | Yes                  | 0h      |
| 31:4 | Reserved                                | RsvdP | Not support.   | No                   | 0-0h    |

### 9.3.269 DUMP WAVEFORM START REGISTER – OFFSET 750h (Port 0 Only)

| BIT  | FUNCTION            | TYPE  | DESCRIPTION                             | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------------|-------|---|----------------------|---------|
| 0    | Dump Waveform Start | RW    | When set, start to dump waveform to LA. | Yes                  | 0       |
| 31:1 | Reserved            | RsvdP | Not support.                            | No                   | 0-0h    |

### 9.3.270 FREE RUN BUTTON REGISTER – OFFSET 754h (Port 0 Only)

| BIT  | FUNCTION        | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------|-------|--|----------------------|---------|
| 0    | Free Run Button | RW    | When set, debug memory will store pre-defined internal debug_out[31:0] data, and output to GPIO[31:0] automatically. | Yes                  | 0       |
| 31:1 | Reserved        | RsvdP | Not support.   | No                   | 0-0h    |

## 9.4 CDLEP CONFIGURATION REGISTERS

When the port of the Switch is set to operate at the cross-domain end point mode, it is represented by an Other Bridge that implementstype 0 configuration space header. The following table details the allocation of the register fields of the PCI 2.3 compatible type 0 configuration space header.

Please be aware of those registers marked as port 0 only, which are defined for management purpose.

| 31 – 24   | 23 – 16                                | 15 – 8   | 7 – 0  | BYTE OFFSET |
|---|--|--|--|-------------|
| <a href="#">Device ID</a>                         |  | <a href="#">Vendor ID</a>                      |  | 00h         |
| <a href="#">Primary Status</a>                    |  | <a href="#">Command</a>                        |  | 04h         |
| <a href="#">Class Code</a>                        |  | <a href="#">Revision ID</a>                    |  | 08h         |
| Reserved  | <a href="#">Header Type</a>            | <a href="#">Primary Latency Timer</a>          | <a href="#">Cache Line Size</a>                                      | 0Ch         |

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

| 31 – 24  | 23 – 16   | 15 – 8   | 7 – 0                                   | BYTE OFFSET |

| 6   | Parity Error Response Enable       | RW    | 0b: Switch may ignore any parity errors that it detects and continue normal operation<br>1b: Switch must take its normal action when a parity error is detected  | No/Yes               | 0       |
| 7   | Wait Cycle Control                 | RsvdP | Not support.   | No                   | 0       |
| 8   | SERR# enable                       | RW    | 0b: Disables the reporting of Non-fatal and Fatal errors detected by the Switch to the Root Complex<br>1b: Enables the Non-fatal and Fatal error reporting to Root Complex   | No/Yes               | 0       |
| 9   | Fast Back-to-Back Enable           | RsvdP | Not support.   | No                   | 0       |
| 10  | Interrupt Disable                  | RW    | Controls the ability of a PCI Express device to generate INTx  | No/Yes               | 0       |

| BIT   | FUNCTION | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------|-------|--|----------------------|---------|
|       |          |       | Interrupt Messages. In the Switch, this bit does not affect the forwarding of INTx messages from the downstream ports. |                      |         |
| 15:11 | Reserved | RsvdP | Not support.   | No                   | 0000_0b |

#### 9.4.4 PRIMARY STATUS REGISTER – OFFSET 04H

| BIT   | FUNCTION                  | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------|-------|---|----------------------|---------|
| 18:16 | Reserved                  | RsvdP | Not support.  | No                   | 000b    |
| 19    | Interrupt Status          | RO    | Indicates that an INTx Interrupt Message is pending internally to the device.<br>In the Switch, the forwarding of INTx messages from the downstream device of the Switch port is not reflected in this bit. Must be hardwired to 0. | No                   | 0       |
| 20    | Capabilities List         | RO    | Set to 1b to enable support for the capability list (offset 34h is the pointer to the data structure).  | Yes/No               | 1       |
| 21    | 66MHz Capable             | RO    | Does not apply to PCI Express. Must be hardwired to 0.  | No                   | 0       |
| 22    | Reserved                  | RsvdP | Not support.  | No                   | 0       |
| 23    | Fast Back-to-Back Capable | RsvdP | Not support.  | No                   | 0       |
| 24    | Master Data Parity Error  | RW1C  | Set to 1b (by a requester) whenever a Parity error is detected or forwarded on the primary side of the port in a Switch.<br><br>If the Parity Error Response Enable bit is cleared, this bit is never set.                          | No/Yes               | 0       |
| 26:25 | DEVSEL# timing            | RsvdP | Not support.  | No                   | 00b     |
| 27    | Signaled Target Abort     | RW1C  | This bit is Set when the Secondary Side for Type 1 Configuration Space header Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted Request as a Completer Abort error.           | No/Yes               | 0       |
| 28    | Received Target Abort     | RsvdP | Not support.  | No                   | 0       |
| 29    | Received Master Abort     | RsvdP | Not support.  | No                   | 0       |
| 30    | Signaled System Error     | RW1C  | Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL message, and the SERR Enable bit in the Command register is 1b.  | No/Yes               | 0       |
| 31    | Detected Parity Error     | RW1C  | Set to 1b whenever the primary side of the port in a Switch receives a Poisoned TLP.  | No/Yes               | 0       |

#### 9.4.5 REVISION REGISTER – OFFSET 08H

| BIT | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT                          |
|-----|----------|------|--------------------------------------|----------------------|----------------------------------|
| 7:0 | Revision | RO   | Indicates revision number of device. | Yes                  | 07h for Port 0<br>06h for Port 4 |

#### 9.4.6 CLASS REGISTER – OFFSET 08H

| BIT   | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|------|---|----------------------|---------|
| 15:8  | Programming Interface | RO   | Read as 00h to indicate no programming interfaces have been defined for PCI-to-PCI Bridges. | No                   | 00h     |
| 23:16 | Sub-Class Code        | RO   | Read as 80h to indicate device is an Other Bridge.  | No                   | 80h     |
| 31:24 | Base Class Code       | RO   | Read as 06h to indicate device is a Bridge device.  | No                   | 06h     |

#### 9.4.7 CACHE LINE REGISTER – OFFSET 0Ch

| BIT | FUNCTION        | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-----------------|------|--|----------------------|---------|
| 7:0 | Cache Line Size | RW   | The cache line size register is set by the system firmware and the | No/Yes               | 00h     |

| BIT | FUNCTION | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------|------|--|----------------------|---------|
|     |          |      | operating system cache line size. This field is implemented by PCI Express devices as a RW field for legacy compatibility, but it has no impact on any PCI Express device functionality. |                      |         |

#### 9.4.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

| BIT  | FUNCTION              | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------------|-------|--------------|----------------------|---------|
| 15:8 | Primary Latency Timer | RsvdP | Not support. | No                   | 00h     |

#### 9.4.9 HEADER TYPE REGISTER – OFFSET 0Ch

| BIT   | FUNCTION    | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------|------|--|----------------------|---------|
| 23:16 | Header Type | RO   | Read as 00h to indicate that the register layout conforms to Type 0 Configuration header for CDLEP port. | No                   | 00h     |

#### 9.4.10 BAR 0 REGISTER – OFFSET 10h

| BIT   | FUNCTION               | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|-------|--|----------------------|---------|
| 0     | Memory Space Indicator | RO    | Reset to 0b to indicate Memory Base address.                         | No                   | 0       |
| 2:1   | 64-bit Addressing      | RO    | 00b: 32-bit addressing<br>10b: 64-bit addressing<br>Others: Reserved | No                   | 00b     |

### 9.4.16 SSVID REGISTER – OFFSET 2Ch

| BIT  | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------|------|--------------------------------------|----------------------|---------|
| 15:0 | SSVID    | RO   | Identifies the sub-system vendor id. | Yes                  | 12D8h   |

### 9.4.17 SSID REGISTER – OFFSET 2Ch

| BIT   | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------|------|--------------------------------------|----------------------|---------|
| 31:16 | SSID     | RO   | Identifies the sub-system device id. | Yes                  | C016h   |

### 9.4.18 CAPABILITY POINTER REGISTER – OFFSET 34h

| BIT | FUNCTION           | TYPE | DESCRIPTION                              | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------|------|--|----------------------|---------|
| 7:0 | Capability Pointer | RO   | Point to first PCI capability structure. | Yes                  | 40h     |

#### 9.4.19 INTERRUPT LINE REGISTER – OFFSET 3Ch

| BIT | FUNCTION       | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------|------|--|----------------------|---------|
| 7:0 | Interrupt Line | RW   | The interrupt line register communicates interrupt line routing information. | No/Yes               | 00h     |

#### 9.4.20 INTERRUPT PIN REGISTER – OFFSET 3Ch

| BIT  | FUNCTION      | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------|------|---|----------------------|---------|
| 15:8 | Interrupt Pin | RO   | The Switch implements INTA virtual wire interrupt signal. | Yes/No               | 01h     |

#### 9.4.21 POWER MANAGEMENT CAPABILITIES REGISTER – OFFSET 40h

| BIT   | FUNCTION                       | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------|-------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID       | RO    | Read as 01h to indicate that this is power management capability register.   | Yes                  | 01h     |
| 15:8  | Next Item Pointer              | RO    | Point to next PCI capability structure.  | Yes                  | 48h     |
| 18:16 | Power Management Revision      | RO    | Read as 011b to indicate the device is compliant to Revision 1.2 of <i>PCI Power Management Interface Specifications</i> . | No                   | 011b    |
| 19    | PME# Clock                     | RO    | Does not apply to PCI Express. Must be hardwired to 0.   | No                   | 0       |
| 20    | Reserved                       | RsvdP | Not support.   | No                   | 0       |
| 21    | Device specific Initialization | RO    | Read as 0b to indicate Switch does not have device specific initialization requirements.                                   | Yes                  | 0       |
| 24:22 | AUX Current                    | RO    | Reset to 000b.   | Yes                  | 000b    |
| 25    | D1 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D1 power management state.  | Yes                  | 0       |
| 26    | D2 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D2 power management state.  | Yes                  | 0       |
| 31:27 | PME# Support                   | RO    | Read as 19h to indicate Switch supports the forwarding of PME# message in D0, D3 and D4 states.                            | Yes                  | C8h     |

#### 9.4.22 POWER MANAGEMENT DATA REGISTER – OFFSET 44h

| BIT   | FUNCTION      | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|-------|--|----------------------|---------|
| 1:0   | Power State   | RW    | Indicates the current power state of the Switch. Writing a value of D0 when the previous state was D3 cause a hot reset without asserting DWRST_L.<br><br>00b: D0 state<br>01b: D1 state<br>10b: D2 state<br>11b: D3 hot state | No/Yes               | 00b     |
| 2     | Reserved      | RsvdP | Not support.   | No                   | 0       |
| 3     | No_Soft_Reset | RO    | When set, this bit indicates that device transitioning from D3hot to D0 does not perform an internal reset. When clear, an internal reset is performed when power state transits from D3hot to D0.                             | Yes                  | 1       |
| 7:4   | Reserved      | RsvdP | Not support.   | No                   | 0h      |
| 8     | PME# Enable   | RW    | When asserted, the Switch will generate the PME# message.  | No/Yes               | 0       |
| 12:9  | Data Select   | RW    | Select data registers.<br><br>RW if offset 4C4h[9]=1 and RO if offset 4C4h[9]=0.   | No/Yes               | 0h      |
| 14:13 | Data Scale    | RO    | Reset to 00b.  | No/Yes               | 00b     |
| 15    | PME Status    | RW1C  | Read as 0b as the PME# message is not implemented.   | No/Yes               | 0       |

### 9.4.23 PPB SUPPORT EXTENSIONS REGISTER – OFFSET 44h

| BIT   | FUNCTION                            | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------------|-------|--------------|----------------------|---------|
| 21:16 | Reserved                            | RsvdP | Not support. | No                   | 00h     |
| 22    | B2_B3 Support for D3 <sub>HOT</sub> | RsvdP | Not support. | No                   | 0       |
| 23    | Bus Power / Clock Control Enable    | RsvdP | Not support. | No                   | 0       |

### 9.4.24 DATA REGISTER– OFFSET 44h

| BIT   | FUNCTION      | TYPE | DESCRIPTION    | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|------|----------------|----------------------|---------|
| 31:24 | Data Register | RO   | Data Register. | Yes                  | 00h     |

### 9.4.25 MSI CAPABILITIES REGISTER – OFFSET 48h

| BIT   | FUNCTION                   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------|------|---|----------------------|---------|
| 7:0   | Enhanced Capabilities ID   | RO   | Read as 05h to indicate that this is message signal interrupt capability register.  | No                   | 05h     |
| 15:8  | Next Item Pointer          | RO   | Point to next PCI capability structure.   | Yes                  | 68h     |
| 16    | MSI Enable                 | RW   | 0b: The function is prohibited from using MSI to request service<br>1b: The function is permitted to use MSI to request service and is prohibited from using its INTx # pin | No/Yes               | 0       |
| 19:17 | Multiple Message Capable   | RO   | Indicate the number of requested vectors.   | Yes                  | 011b    |
| 22:20 | Multiple Message Enable    | RW   | Software writes to this field to indicate the number of allocated vectors (equal to or less than the number of requested vectors.)  | No/Yes               | 000b    |
| 23    | 64-bit address capable     | RO   | 0b: The function is not capable of generating a 64-bit message address<br>1b: The function is capable of generating a 64-bit message address                                | Yes                  | 1b      |
| 24    | Pre-vector Masking Capable | RO   | 1b: the function supports MSI pre-vector masking.<br>0b: the function does Not support MSI pre-vector masking.  | Yes                  | 1b      |
| 31:25 | Reserved                   | RO   | Not support.  | No                   | 00h     |

### 9.4.26 MESSAGE ADDRESS REGISTER – OFFSET 4Ch

| BIT  | FUNCTION        | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------|-------|---|----------------------|---------|
| 1:0  | Reserved        | RsvdP | Not support.  | No                   | 00b     |
| 31:2 | Message Address | RW    | If the message enable bit is set, the contents of this register specify the DWORD aligned address for MSI memory write transaction. | No/Yes               | 0-0h    |

### 9.4.27 MESSAGE UPPER ADDRESS REGISTER – OFFSET 50h

| BIT  | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------------------|------|---|----------------------|------------|
| 31:0 | Message Upper Address | RW   | This register is only effective if the device supports a 64-bit message address is set. | No/Yes               | 0000_0000h |

### 9.4.28 MESSAGE DATA REGISTER – OFFSET 54h

| BIT  | FUNCTION     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--------------|------|---------------|----------------------|---------|
| 15:0 | Message Data | RW   | Message data. | No/Yes               | 0000h   |

### 9.4.29 MESSAGE MASK REGISTER – OFFSET 58h

| BIT  | FUNCTION                    | TYPE  | DESCRIPTION                             | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|-----------------------------|-------|---|----------------------|-----------|
| 0    | MSI Mask for Hot Plug       | RW    | MSI mask for Hot Plug interrupts.       | No/Yes               | 0         |
| 1    | MSI Mask for DPC            | RW    | MSI mask for DPC interrupts.            | No/Yes               | 0         |
| 2    | MSI Mask for DMA and GPIO   | RW    | MSI mask for DMAGPIO interrupts.        | No/Yes               | 0         |
| 3    | MSI Mask for CDEP           | RW    | MSI mask for CDEP interrupts.           | No/Yes               | 0         |
| 4    | Reserved                    | RsvdP | Not support.                            | No                   | 0         |
| 5    | MSI Mask for thermal sensor | RW    | MSI mask for thermal sensor interrupts. | No/Yes               | 0         |
| 7:6  | Reserved                    | RW    | Not support.                            | No                   | 00        |
| 31:8 | Reserved                    | RsvdP | Not support.                            | No                   | 0000_000h |

### 9.4.30 MESSAGE PENDING REGISTER – OFFSET 5Ch

| BIT  | FUNCTION                                  | TYPE  | DESCRIPTION                                       | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|---|-------|---|----------------------|-----------|
| 0    | MSI Pending for Hot Plug Interrupts       | RO    | MSI pending status for Hot Plug interrupts.       | No                   | 0         |
| 1    | MSI Pending for DPC Interrupts            | RO    | MSI pending status for DPC interrupts.            | No                   | 0         |
| 2    | MSI Pending for GPIO Interrupts           | RO    | MSI pending status for GPIO interrupts.           | No                   | 0         |
| 3    | MSI Pending for CDEP Interrupts           | RO    | MSI pending status for CDEP interrupts.           | No                   | 0         |
| 4    | Reserved                                  | RsvdP | Not support.                                      | No                   | 0         |
| 5    | MSI Pending for thermal sensor Interrupts | RO    | MSI pending status for thermal sensor interrupts. | No                   | 0         |
| 31:6 | Reserved                                  | RsvdP | Not support.                                      | No                   | 0000_000h |

### 9.4.31 PCI EXPRESS CAPABILITIES REGISTER – OFFSET 68h

| BIT   | FUNCTION                 | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|-------|---|----------------------|---------|
| 7:0   | Enhanced Capabilities ID | RO    | Read as 10h to indicate that this is PCI express enhanced capability register.                              | No                   | 10h     |
| 15:8  | Next Item Pointer        | RO    | Point to next PCI capability structure.   | Yes                  | A4h     |
| 19:16 | Capability Version       | RO    | Read as 2h to indicate the device is compliant to Revision .2.0 of <i>PCI Express Base Specifications</i> . | Yes                  | 2h      |
| 23:20 | Device/Port Type         | RO    | Indicates the type of PCI Express logical device.   | Yes                  | 00h     |
| 24    | Slot Implemented         | RsvdP | Not support.  | No                   | 0       |
| 29:25 | Interrupt Message Number | RO    | No MSI messages are generated in the transparent mode.  | No                   | 00_000b |
| 31:30 | Reserved                 | RsvdP | Not support.  | No                   | 00b     |

### 9.4.32 DEVICE CAPABILITIES REGISTER – OFFSET 6Ch

| BIT   | FUNCTION                     | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|-------|--|----------------------|---------|
| 2:0   | Max_Payload_Size Supported   | RO    | Indicates the maximum payload size that the device can support for TLPs. Each port of the Switch supports 512 bytes max payload size.        | Yes/No               | 010b    |
| 4:3   | Phantom Functions Supported  | RO    | Indicates the support for use of unclaimed function numbers as Phantom functions. Read as 00b, since the Switch does not act as a requester. | No                   | 00b     |
| 5     | Extended Tag Field Supported | RO    | Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the Switch does not act as a requester.                   | No                   | 0       |
| 8:6   | Reserved                     | RsvdP | Not support.   | No                   | 111b    |
| 11:9  | Reserved                     | RsvdP | Not support.   | No                   | 111b    |
| 14:12 | Reserved                     | RsvdP | Not support.   | No                   | 000b    |

| BIT   | FUNCTION                        | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------------|-------|--|----------------------|---------|
| 15    | Role_Based Error Reporting      | RO    | When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN.  | Yes                  | 1       |
| 17:16 | Reserved                        | RsvdP | Not support.   | No                   | 00b     |
| 25:18 | Captured Slot Power Limit Value | RO    | In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00h. | No                   | 00h     |
| 27:26 | Captured Slot Power Limit Scale | RO    | Specifies the scale used for the Slot Power Limit Value.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00b.   | No                   | 00b     |
| 31:28 | Reserved                        | RsvdP | Not support.   | No                   | 0h      |

### 9.4.33 DEVICE CONTROL REGISTER – OFFSET 70h

| BIT   | FUNCTION                             | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------------|-------|--|----------------------|---------|
| 0     | Correctable Error Reporting Enable   | RW    | 0b: Disable Correctable Error Reporting<br>1b: Enable Correctable Error Reporting  | No/Yes               | 0       |
| 1     | Non-Fatal Error Reporting Enable     | RW    | 0b: Disable Non-Fatal Error Reporting<br>1b: Enable Non-Fatal Error Reporting  | No/Yes               | 0       |
| 2     | Fatal Error Reporting Enable         | RW    | 0b: Disable Fatal Error Reporting<br>1b: Enable Fatal Error Reporting  | No/Yes               | 0       |
| 3     | Unsupported Request Reporting Enable | RW    | 0b: Disable Unsupported Request Reporting<br>1b: Enable Unsupported Request Reporting  | No/Yes               | 0       |
| 4     | Enable Relaxed Ordering              | RsvdP | When set, it permits the device to set the Relaxed Ordering bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.   | No                   | 0       |
| 7:5   | Max_Payload_Size                     | RW    | This field sets maximum TLP payload size for the device. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported in the Device Capabilities register. Any value exceeding the Max_Payload_Size Supported written to this register results into clamping to the Max_Payload_Size Supported value. | No/Yes               | 000b    |
| 8     | Extended Tag Field Enable            | RW    | 0b: Disable Extended Tag Field<br>1b: Enable Extended Tag Field  | No/Yes               | 0       |
| 9     | Phantom Function Enable              | RsvdP | Does not apply to PCI Express Switch. Returns '0' when read.   | No                   | 0       |
| 10    | Auxiliary (AUX) Power PM Enable      | RO    | When set, indicates that a device is enabled to draw AUX power independent of PME AUX power.   | No                   | 0       |
| 11    | Enable No Snoop                      | RsvdP | When set, it permits to set the No Snoop bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.  | No                   | 0       |
| 14:12 | Max_Read_Request_Size                | RsvdP | This field sets the maximum Read Request size for the device as a Requester. Since the Switch does not generate read request by itself, these bits are hardwired to 000b.  | No                   | 000b    |
| 15    | Reserved                             | RsvdP | Not support.   | No                   | 0       |

### 9.4.34 DEVICE STATUS REGISTER – OFFSET 70h

| BIT | FUNCTION                   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------------------|------|---|----------------------|---------|
| 16  | Correctable Error Detected | RW1C | Asserted when correctable error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. | No/Yes               | 0       |
| 17  | Non-Fatal Error Detected   | RW1C | Asserted when non-fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.   | No/Yes               | 0       |

| BIT   | FUNCTION                     | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|-------|---|----------------------|---------|
| 18    | Fatal Error Detected         | RW1C  | Asserted when fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.         | No/Yes               | 0       |
| 19    | Unsupported Request Detected | RW1C  | Asserted when unsupported request is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. | No/Yes               | 0       |
| 20    | AUX Power Detected           | RO    | Asserted when the AUX power is detected by the Switch   | No                   | 0       |
| 21    | Transactions Pending         | RO    | Each port of Switch does not issue Non-posted Requests on its own behalf, so this bit is hardwired to 0b.   | No                   | 0       |
| 31:22 | Reserved                     | RsvdP | Not support.  | No                   | 0-0h    |

#### 9.4.51 SUBSYSTEM VENDOR ID REGISTER – OFFSET A8h

| BIT  | FUNCTION | TYPE | DESCRIPTION                            | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------|------|--|----------------------|---------|
| 15:0 | SSVID    | RO   | It indicates the sub-system vendor id. | Yes                  | 12D8h   |

#### 9.4.52 SUBSYSTEM ID REGISTER – OFFSET A8h

| BIT   | FUNCTION | TYPE | DESCRIPTION                            | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------|------|--|----------------------|---------|
| 31:16 | SSID     | RO   | It indicates the sub-system device id. | Yes                  | C016h   |

#### 9.4.53 MSI-X CAPATILITIES REGISTER – OFFSET B0h

| BIT   | FUNCTION              | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|-------|---|----------------------|---------|
| 7:0   | MSI-X Capabilities ID | RO    | Read as 11h to indicate that this is MSI-X capability register.   | No                   | 11h     |
| 15:8  | Next Item Pointer     | RO    | Indicates next capability pointer.  | Yes                  | C8h     |
| 26:16 | Table Size            | RO    | System software reads this field to determine the MSI-X Table Size N, which is encoded as N-1.  | No                   | 005h    |
| 29:27 | Reserved              | RsvdP | Not support.  | No                   | 000b    |
| 30    | Function Mask         | RW    | If set, all of the vectors associated with the function are masked, regardless of their per-vector mask bit values.<br>If clear, each vector's mask bit determines whether the vector is masked or not.   | No/Yes               | 0       |
| 31    | MSI-X Enable          | RW    | If set and the MSI Enable bit in the MSI Message Control register is clear, the function is permitted to use MSI-X to request service and is prohibited from using INTx interrupts (if implemented).<br>If clear, the function is prohibited from using MSI-X to request service. | No/Yes               | 0       |

#### 9.4.54 MSI-X TABLE OFFSET / TABLE BIR REGISTER – OFFSET B4h

| BIT  | FUNCTION     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|---|----------------------|------------|
| 2:0  | Table BIR    | RO   | Read as 000b to indicate Base Address 0 register (offset 10h in Configuration Space) is used to map the function MSI-X Table into Memory space. | Yes                  | 000b       |
| 31:3 | Table Offset | RO   | Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table.           | Yes                  | 0000_FE00h |

#### 9.4.55 MSI-X PBA OFFSET / PBA BIR REGISTER – OFFSET B8h

| BIT  | FUNCTION   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------|------|---|----------------------|------------|
| 2:0  | PBA BIR    | RO   | Read as 000b to indicate Base Address 0 register (offset 10h in Configuration Space) is used to map the function MSI-X PBA into Memory space. | Yes                  | 000b       |
| 31:3 | PBA Offset | RO   | Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA.           | Yes                  | 0000_FE10h |

#### 9.4.56 VENDOR SPECIFIC CAPABILITIES REGISTER – OFFSET C8h

| BIT   | FUNCTION                 | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID | RO   | Read as 09h to indicate that these are vendor specific capability registers.               | No                   | 09h     |
| 15:8  | Next Item Pointer        | RO   | Read as 00h. No other ECP registers.   | No                   | 00h     |
| 31:16 | Length Information       | RO   | The length field provides the information for number of bytes in the capability structure. | No                   | 0038h   |

#### 9.4.57 BAR 0 CONFIGURATION REGISTER – OFFSET E0h

### 9.4.67 CORRECTABLE ERROR STATUS REGISTER – OFFSET 110h

| BIT   | FUNCTION                        | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------------|-------|--|----------------------|---------|
| 0     | Receiver Error Status           | RW1C  | When set, the Receiver Error event is detected.                | No/Yes               | 0       |
| 5:1   | Reserved                        | RsvdP | Not support.   | No                   | 0_000b  |
| 6     | Bad TLP Status                  | RW1C  | When set, the event of Bad TLP has been received is detected.  | No/Yes               | 0       |
| 7     | Bad DLLP Status                 | RW1C  | When set, the event of Bad DLLP has been received is detected. | No/Yes               | 0       |
| 8     | REPLAY_NUM Rollover Status      | RW1C  | When set, the REPLAY_NUM Rollover event is detected.           | No/Yes               | 0       |
| 11:9  | Reserved                        | RsvdP | Not support.   | No                   | 000b    |
| 12    | Replay Timer Timeout Status     | RW1C  | When set, the Replay Timer Timeout event is detected.          | No/Yes               | 0       |
| 13    | Advisory Non-Fatal Error Status | RW1C  | When set, the Advisory Non-Fatal Error event is detected.      | No/Yes               | 0       |
| 14    | Corrected Internal Error Status | RW1C  | When set, the Corrected Internal Error event is detected.      | No/Yes               | 0       |
| 31:15 | Reserved                        | RsvdP | Not support.   | No                   | 0-0h    |

### 9.4.68 CORRECTABLE ERROR MASK REGISTER – OFFSET 114h

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------|-------|---|----------------------|---------|
| 0     | Receiver Error Mask           | RW    | When set, the Receiver Error event is not logged in the Header Log register and not issued as an Error Message to RC either.                | Yes                  | 0       |
| 5:1   | Reserved                      | RsvdP | Not support.  | No                   | 0_000b  |
| 6     | Bad TLPMask                   | RW    | When set, the event of Bad TLP has been received is not logged in the Header Log register and not issued as an Error Message to RC either.  | Yes                  | 0       |
| 7     | Bad DLLP Mask                 | RW    | When set, the event of Bad DLLP has been received is not logged in the Header Log register and not issued as an Error Message to RC either. | Yes                  | 0       |
| 8     | REPLAY_NUM Rollover Mask      | RW    | When set, the REPLAY_NUM Rollover event is not logged in the Header Log register and not issued as an Error Message to RC either.           | Yes                  | 0       |
| 11:9  | Reserved                      | RsvdP | Not support.  | No                   | 000b    |
| 12    | Replay Timer Timeout Mask     | RW    | When set, the Replay Timer Timeout event is not logged in the Header Log register and not issued as an Error Message to RC either.          | Yes                  | 0       |
| 13    | Advisory Non-Fatal Error Mask | RW    | When set, the Advisory Non-Fatal Error event is not logged in the Header Long register and not issued as an Error Message to RC either.     | Yes                  | 1       |
| 14    | Corrected Internal Error Mask | RW    | When set, the corrected internal error event is not logged in the Header Log register and not issued as an Error Message to RC either.      | Yes                  | 1       |
| 31:15 | Reserved                      | RsvdP | Not support.  | No                   | 0-0h    |

### 9.4.69 ADVANCE ERROR CAPABILITIES AND CONTROL REGISTER – OFFSET 118h

| BIT  | FUNCTION                | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-------------------------|-------|---|----------------------|---------|
| 4:0  | First Error Pointer     | RO    | It indicates the bit position of the first error reported in the Uncorrectable Error Status register. | No                   | 0_0000b |
| 5    | ECRC Generation Capable | RO    | When set, it indicates the Switch has the capability to generate ECRC.                                | Yes                  | 1       |
| 6    | ECRC Generation Enable  | RW    | When set, it enables the generation of ECRC when needed.  | Yes                  | 0       |
| 7    | ECRC Check Capable      | RO    | When set, it indicates the Switch has the capability to check ECRC.                                   | Yes                  | 1       |
| 8    | ECRC Check Enable       | RW    | When set, the function of checking ECRC is enabled.   | Yes                  | 0       |
| 31:9 | Reserved                | RsvdP | Not support.  | No                   | 0-0h    |

### 9.4.70 HEADER LOG REGISTER – OFFSET From 11Ch to 128h

| BIT    | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|--------|-----------------------|------|---|----------------------|------------|
| 31:0   | 1 <sup>st</sup> DWORD | RO   | Hold the 1st DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |
| 63:32  | 2 <sup>nd</sup> DWORD | RO   | Hold the 2nd DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |
| 95:64  | 3 <sup>rd</sup> DWORD | RO   | Hold the 3rd DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |
| 127:96 | 4 <sup>th</sup> DWORD | RO   | Hold the 4th DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |

### 9.4.71 PCI EXPRESS VIRTUAL CHANNEL ENHANCED CAPABILITYHEADER REGISTER – OFFSET 130h

| BIT  | FUNCTION | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------|------|---|----------------------|---------|
| 15:0 | Extended | RO   | Read as 0002h to indicate that this is PCI express extended | No                   | 02h     |

| BIT   | FUNCTION               | TYPE | DESCRIPTION                                      | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|------|--|----------------------|---------|
|       | Capabilities ID        |      | capability register for virtual channel.         |                      |         |
| 19:16 | Capability Version     | RO   | Read as 1h.                                      | No                   | 1h      |
| 31:20 | Next Capability Offset | RO   | Point to next PCI extended capability structure. | Yes                  | 1A0h    |

#### 9.4.72 PORT VC CAPABILITY REGISTER 1 – OFFSET 134h

| BIT   | FUNCTION                          | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------------|-------|---|----------------------|---------|
| 2:0   | Extended VC Count                 | RO    | It indicates the number of extended Virtual Channels in addition to the default VC supported by the Switch.   | No                   | 000b    |
| 3     | Reserved                          | RO    | Not support.  | No                   | 0       |
| 6:4   | Low Priority Extended VC Count    | RO    | It indicates the number of extended Virtual Channels in addition to the default VC belonging to the low-priority VC (LPVC) group.                       | No                   | 000b    |
| 7     | Reserved                          | RO    | Not support.  | No                   | 0       |
| 9:8   | Reference Clock                   | RO    | It indicates the reference clock for Virtual Channels that support time-based WRR Port Arbitration. Defined encoding is 00b for 100 ns reference clock. | No                   | 00b     |
| 11:10 | Port Arbitration Table Entry Size | RO    | Read as 10b to indicate the size of Port Arbitration table entry in the device is 4 bits.   | No                   | 10b     |
| 31:12 | Reserved                          | RsvdP | Not support.  | No                   | 0000_0h |

#### 9.4.73 PORT VC CAPABILITY REGISTER 2 – OFFSET 138h

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|---|----------------------|---------|
| 7:0   | VC Arbitration Capability   | RO    | It indicates the types of VC Arbitration supported by the device for the LPVC group. This field is valid when LPVC is greater than 0. The Switch supports Hardware fixed arbitration scheme, e.g., Round Robin and Weight Round Robin arbitration with 32 phases in LPVC. | No                   | 00h     |
| 23:8  | Reserved                    | RsvdP | Not support.  | No                   | 0000h   |
| 31:24 | VC Arbitration Table Offset | RO    | It indicates the location of the VC Arbitration Table as an offset from the base address of the Virtual Channel Capability register in the unit of DQWD (16 bytes).   | No                   | 00h     |

#### 9.4.74 PORT VC CONTROL REGISTER – OFFSET 13Ch

| BIT  | FUNCTION                  | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------------------|-------|--|----------------------|---------|
| 0    | Load VC Arbitration Table | WO    | When set, the programmed VC Arbitration Table is applied to the hardware. This bit always returns 0b when read.  | Yes/No               | 0       |
| 3:1  | VC Arbitration Select     | RW    | This field is used to configure the VC Arbitration by selecting one of the supported VC Arbitration schemes. The valid values for the schemes supported by Switch are 0b and 1b. Other value than these written into this register will be treated as default. | No                   | 000b    |
| 15:4 | Reserved                  | RsvdP | Not support.   | No                   | 000h    |

#### 9.4.75 PORT VC STATUS REGISTER – OFFSET 13Ch

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|---|----------------------|---------|
| 16    | VC Arbitration Table Status | RO    | When set, it indicates that any entry of the VC Arbitration Table is written by software. This bit is cleared when hardware finishes loading values stored in the VC Arbitration Table after the bit of “Load VC Arbitration Table” is set. | No                   | 0       |
| 31:17 | Reserved                    | RsvdP | Not support.  | No                   | 0-0h    |

### 9.4.76 VC RESOURCE CAPABILITY REGISTER (0) – OFFSET 140h

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|-------------------------------|-------|---|----------------------|----------|
| 7:0   | Port Arbitration Capability   | RO    | It indicates the types of Port Arbitration supported by the VC resource. The Switch supports Round Robin Hardware fixed arbitration scheme.                               | No                   | 01h      |
| 13:8  | Reserved                      | RsvdP | Not support.  | No                   | 00_0000h |
| 14    | Advanced Packet Switching     | RO    | When set, it indicates the VC resource only supports transaction optimized for Advanced Packet Switching (AS).  | No                   | 0        |
| 15    | Reject Snoop Transactions     | RsvdP | Not support.  | No                   | 0        |
| 22:16 | Maximum Time Slots            | RO    | It indicates the maximum numbers of time slots (minus one) are allocated for Isochronous traffic.   | No                   | 3Fh      |
| 23    | Reserved                      | RsvdP | Not support.  | No                   | 0        |
| 31:24 | Port Arbitration Table Offset | RO    | It indicates the location of the Port Arbitration Table (n) as an offset from the base address of the Virtual Channel Capability register in the unit of DQWD (16 bytes). | No                   | 05h      |

### 9.4.77 VC RESOURCE CONTROL REGISTER (0)– OFFSET 144h

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|--|----------------------|---------|
| 7:0   | TC/VC Map                   | RW    | This field indicates the TCs that are mapped to the VC resource. Bit locations within this field correspond to TC values. When the bits in this field are set, it means that the corresponding TCs are mapped to the VC resource. Bit 0 of this field is read-only and must be set to “1” for the VC0. | No/Yes               | FFh     |
| 15:8  | Reserved                    | RsvdP | Not support.   | No                   | 00h     |
| 16    | Load Port Arbitration Table | RW    | When set, the programmed Port Arbitration Table is applied to the hardware. This bit always returns 0b when read.  | No/Yes               | 0       |
| 19:17 | Port Arbitration Select     | RW    | This field is used to configure the Port Arbitration by selecting one of the supported Port Arbitration schemes. The permissible values for the schemes supported by Switch are 000b and 011b at VC0, other value than these written into this register will be treated as default.                    | No/Yes               | 000b    |
| 23:20 | Reserved                    | RsvdP | Not support.   | No                   | 0h      |
| 26:24 | VC ID                       | RO    | This field assigns a VC ID to the VC resource.   | No                   | 000b    |
| 30:27 | Reserved                    | RsvdP | Not support.   | No                   | 0h      |
| 31    | VC Enable                   | RW    | 0b: it disables this Virtual Channel<br>1b: it enables this Virtual Channel  | No/Yes               | 1       |

### 9.4.78 VC RESOURCE STATUS REGISTER (0) – OFFSET 148h

| BIT   | FUNCTION                      | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------------------|-------|---|----------------------|---------|
| 15:0  | Reserved                      | RsvdP | Not support.  | No                   | 0000h   |
| 16    | Port Arbitration Table Status | RO    | When set, it indicates that any entry of the Port Arbitration Table is written by software. This bit is cleared when hardware finishes loading values stored in the Port Arbitration Table after the bit of “Load Port Arbitration Table” is set. | No                   | 0       |
| 17    | VC Negotiation Pending        | RO    | When set, it indicates that the VC resource is still in the process of negotiation. This bit is cleared after the VC negotiation is complete.   | No                   | 1       |
| 31:18 | Reserved                      | RsvdP | Not support.  | No                   | 0-0h    |

### 9.4.79 DEVICE SERIAL NUMBER ENHANCED CAPABILITY HEADER REGISTER – OFFSET 1A0h

| BIT  | FUNCTION                 | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--------------------------|------|---|----------------------|---------|
| 15:0 | Extended Capabilities ID | RO   | Indicates that these are PCI express extended capability registers for device serial number extend capability register. | No                   | 0003h   |

| BIT   | FUNCTION               | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|------|---|----------------------|---------|
| 19:16 | Capability Version     | RO   | Must be 1h for this version.                                      | No                   | 1h      |
| 31:20 | Next Capability Offset | RO   | Pointer points to the Power Budget Extended Capability structure. | Yes                  | 1B0h    |

#### 9.4.80 DEVICE SERIAL NUMBER LOWER DW REGISTER – OFFSET 1A4h

| BIT  | FUNCTION                                   | TYPE | DESCRIPTION                           | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--|------|---------------------------------------|----------------------|------------|
| 31:0 | Device serial number<br>1 <sup>st</sup> DW | RO   | First dword for device serial number. | Yes                  | 0000_12D8h |

#### 9.4.81 DEVICE SERIAL NUMBER HIGHER DW REGISTER – OFFSET 1A8h

| BIT  | FUNCTION                                   | TYPE | DESCRIPTION                                     | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--|------|---|----------------------|------------|
| 31:0 | Device serial number<br>2 <sup>nd</sup> DW | RO   | 2 <sup>nd</sup> dword for device serial number. | Yes                  | 0816_4896h |

#### 9.4.82 PCI EXPRESS POWER BUDGETING ENHANCED CAPABILITY HEADER REGISTER – OFFSET 1B0h

| BIT   | FUNCTION                 | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|------|--|----------------------|---------|
| 15:0  | Extended Capabilities ID | RO   | Read as 0004h to indicate that this is PCI express extended capability register for power budgeting. | No                   | 0004h   |
| 19:16 | Capability Version       | RO   | Must be 1h for this version.   | No                   | 01h     |
| 31:20 | Next Capability Offset   | RO   | Point to next PCI extended capability structure.   | Yes                  | 210h    |

#### 9.4.83 DATA SELECT REGISTER – OFFSET 1B4h

| BIT  | FUNCTION       | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------------|-------|---|----------------------|---------|
| 7:0  | Data Selection | RW    | It indexes the power budgeting data reported through the data register.<br><br>When 00h, it selects D0 Max power budget<br>When 01h, it selects D0 Sustained power budget<br>Other values would return zero power budgets, which means Not supported. | No/Yes               | 00h     |
| 31:8 | Reserved       | RsvdP | Not support.  | No                   | 0-0h    |

#### 9.4.84 POWER BUDGETING DATA REGISTER – OFFSET 1B8h

| BIT   | FUNCTION     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|--------------|------|---|----------------------|--|
| 7:0   | Base Power   | RO   | It specifies the base power value in watts. This value represents the required power budget in the given operation condition. | Yes                  | 04h if<br><a href="#">13Ch.bit[0]=0</a><br>03h if<br><a href="#">13Ch.bit[0]=1</a> |
| 9:8   | Data Scale   | RO   | It specifies the scale to apply to the base power value.  | Yes                  | 00b  |
| 12:10 | PM Sub State | RO   | It specifies the power management sub state of the given operation condition.<br>It is initialized to the default sub state.  | No                   | 000b   |
| 14:13 | PM State     | RO   | It specifies the power management state of the given operation condition.<br><br>It defaults to the D0 power state.           | Yes                  | 00b  |

| BIT   | FUNCTION   | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|------------|-------|---|----------------------|--|
| 17:15 | Type       | RO    | It specifies the type of the given operation condition which is controlled by <a href="#">offset 13Ch[7:0]</a> .<br><br>It defaults to the Maximum power state. | Yes                  | 7h if <a href="#">13Ch.bit[0]=0</a><br>3h if <a href="#">13Ch.bit[0]=1</a> |
| 20:18 | Power Rail | RO    | It specifies the power rail of the given operation condition..  | Yes                  | 010b   |
| 31:21 | Reserved   | RsvdP | Not support.  | No                   | 0-0h   |

#### 9.4.85 POWER BUDGET CAPABILITY REGISTER – OFFSET 1BCh

| BIT  | FUNCTION         | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|------------------|-------|---|----------------------|---------|
| 0    | System Allocated | RO    | When set, it indicates that the power budget for the device is included within the system power budget. | Yes                  | 1       |
| 31:1 | Reserved         | RsvdP | Not support.  | No                   | 0-0h    |

#### 9.4.86 SECONDARY PCI EXPRESS EXTENDED CAPABILITY HEADER – OFFSET 210h

| BIT   | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|------|--|----------------------|---------|
| 15:0  | PCI Express Extended Capability ID | RO   | Read as 0019h to indicate that this is PCI Express Extended Capability register for Secondary PCI Express. | No                   | 0019h   |
| 19:16 | Capability Version                 | RO   | Must be 1h for this version.   | No                   | 1h      |
| 31:20 | Next Capability ID                 | RO   | Point to next PCI extended capability structure.   | Yes                  | 2B0h    |

#### 9.4.87 LINK CONTROL 3 REGISTER – OFFSET 214h

| BIT  | FUNCTION                                   | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--|-------|---|----------------------|---------|
| 0    | Perform Equalization                       | RW    | When this bit is 1b and a 1b is written to the Retrain Link bit with the Target Link Speed field set to 8.0 GT/s, the downstream port must perform Link Equalization. | No/Yes               | 0       |
| 1    | Link Equalization Request Interrupt Enable | RW    | When set, this bit enables the generation of an interrupt to indicate that the Link Equalization bit has been set.  | No/Yes               | 0       |
| 31:2 | Reserved                                   | RsvdP | Not support.  | No                   | 0-0h    |

#### 9.4.88 LANE ERROR STATUS REGISTER – OFFSET 218h

| BIT  | FUNCTION          | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-------------------|------|--|----------------------|------------|
| 31:0 | Lane Error Status | RW1C | Each bit indicates if the corresponding Lane detected a Lane-base error. | No/Yes               | 0000_0000h |

#### 9.4.89 LANE EQUALIZATION CONTROL REGISTER – OFFSET 21Ch – 230h

**Table 9-4 Lane Equalization Control Register Locations**

| CFG_OFFSET | Lane Number | CFG_OFFSET | Lane Number |
|------------|-------------|------------|-------------|
| 21Ch       | 0           | 22Ch       | 8           |
| 21Eh       | 1           | 22Eh       | 9           |
| 220h       | 2           | 230h       | 10          |
| 222h       | 3           | 232h       | 11          |
| 224h       | 4           | 234h       | 12          |
| 226h       | 5           | 236h       | 13          |
| 228h       | 6           | 238h       | 14          |
| 22Ah       | 7           | 23Ah       | 15          |

**Table 9-5 Lane Equalization Control Register Definitions**

| BIT   | FUNCTION                             | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------------|-------|--|----------------------|---------|
| 3:0   | Downstream Port Transmitter Preset   | RW    | Transmitter Preset used for equalization by this Port.                                   | No                   | 0       |
| 7:4   | Downstream Port Receiver Preset Hint | RW    | Receiver Preset Hint may be used as a hint for receiver equalization by this Port.       | No                   | 0       |
| 11:8  | Upstream Port Transmitter Preset     | RO    | Field contains the Transmit Preset value sent or received during Link Equalization.      | No                   | 8h      |
| 14:12 | Upstream Port Receiver Preset Hint   | RO    | Field contains the Receiver Preset Hint value sent or received during Link Equalization. | No                   | 2h      |
| 15    | Reserved                             | RsvdP | Not support.   | No                   | 0       |

#### 9.4.90 LI PM SUBSTATES ENHANCED CAPABILITY HEADER – OFFSET 2B0h

| BIT   | FUNCTION                           | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|------|--|----------------------|---------|
| 15:0  | PCI Express Extended Capability ID | RO   | Read as 001Eh to indicate that this is PCI Express Extended Capability register for L1 PM Substates. | No                   | 001Eh   |
| 19:16 | Capability Version                 | RO   | Must be 1h for this version.   | No                   | 1h      |
| 31:20 | Next Capability ID                 | RO   | Point to next PCI extended capability structure.   | Yes                  | 300h    |

#### 9.4.91 L1 PM SUBSTATES CAPABILITY REGISTER – OFFSET 2B4h

| BIT  | FUNCTION                  | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------------------|-------|--|----------------------|---------|
| 0    | PCI-PM L1.2 Supported     | RO    | When set this bit indicates that PCI-PM L1.2 is supported.   | Yes                  | 0       |
| 1    | PCI-PM L1.1 Supported     | RO    | When set this bit indicates that PCI-PM L1.1 is supported and must be set by all ports implementing L1 PM Substates. | Yes                  | 0       |
| 3:2  | Reserved                  | RsvdP | Not support.   | No                   | 00b     |
| 4    | L1 PM Substates Supported | RO    | When set this bit indicates that this port supports L1 PM Substates.   | Yes                  | 1       |
| 31:5 | Reserved                  | RsvdP | Not support.   | No                   | 0-0h    |

#### 9.4.92 L1 PM SUBSTATES CONTROL 1 REGISTER – OFFSET 2B8h

| BIT  | FUNCTION           | TYPE  | DESCRIPTION                                      | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--------------------|-------|--|----------------------|---------|
| 0    | PCI-PM L1.2 Enable | RW    | When set this bit enables PCI-PM L1.2. Required. | No/Yes               | 0       |
| 1    | PCI-PM L1.1 Enable | RW    | When set this bit enables PCI-PM L1.1. Required. | No/Yes               | 0       |
| 31:2 | Reserved           | RsvdP | Not support.                                     | No                   | 0-0h    |

#### 9.4.93 L1 PM SUBSTATES CONTROL 2 REGISTER – OFFSET 2BCh

| 31:0 | LUT HData[31:0] | RW   | Used to indicate the higher 32-bit destination base address in 64-bit address domain. | Yes                  | 0000_0000h |

#### 9.4.252 REQ ID/DOMAIN LUT 0 – 15– OFFSET 924h to 960h

These 16 32-bit registers construct a Requester ID (RID) look-up table storing the RID of TLP issued from Remote Host, which connected to the CDLEP port directly. The table content can be either built by hardware automatically or written by software of management CPU. There are control signals defined in the 14<sup>th</sup> and 15<sup>th</sup> bits of [Device Configuration 2 Register at offset 50Ch of Port 0](#) to decide RID LUT build-up mechanism for CDLEP P0 and CDLEP P4 respectively.

**Table 9-6 16-Bit REQ ID/Domain LUT Entry 0-63 Register Locations**

| CFG_OFFSET | ID/DomainLUT Entry_n | CFG_OFFSET | ID/Domain LUT Entry_n |
|------------|----------------------|------------|-----------------------|
| 924h       | 0                    | 944h       | 8                     |
| 928h       | 1                    | 948h       | 9                     |

#### 9.4.253 CAPTURED BUS ID for DOMAIN 0 to 1 – OFFSET 994h

| BIT | FUNCTION          | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-------------------|------|---|----------------------|---------|
| 7:0 | Dom. 0 Bus Number | RW   | To set the captured bus number for Domain 0 as a destination Bus Number in RID translation. | Yes                  | 00h     |

| BIT   | FUNCTION         | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------|-------|---|----------------------|---------|
| 15:8  | Dom 1 Bus Number | RW    | To set the captured bus number for Domain 1 as a destination Bus Number in RID translation. | Yes                  | 00h     |
| 31:16 | Reserved         | RsvdP | Not Support.  | No                   | 00h     |

#### 9.4.254 DOOR BELL IRQ SET REGISTER – OFFSET 9C4h

| BIT  | FUNCTION | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|----------|------|--|----------------------|------------|
| 31:0 | Set IRQ  | RW1S | Set link interface IRQ.<br><br>If any of 32 bits is set and the corresponding bit in Door Bell IRQ register is not set, an interrupt will be issued in the link interface to remote host. Writing“0” to this register does not take any effect.<br><br>Interrupt can be in either INTx or MSI or MSI-X format depending on how system enabling which type of interrupts mechanism. | Yes                  | 0000_0000h |

#### 9.4.255 DOOR BELL IRQ CLEAR REGISTER – OFFSET 9C8h

| BIT  | FUNCTION  | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------|------|---|----------------------|------------|
| 31:0 | Clear IRQ | RW1C | Clear link interface IRQ.<br><br>Writing“1” to the bit whose corresponding bit is set in 9C4h will clear the bit. If INTx mechanism is chosen, an INTx deassert message will be generated.<br><br>Writing“0” to this register does not take any effect. | Yes                  | 0000_0000h |

#### 9.4.256 DOOR BELL IRQ MASK SET REGISTER – OFFSET 9CCh

| BIT  | FUNCTION     | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|---|----------------------|------------|
| 31:0 | Set IRQ Mask | RW1S | Set link interface interrupt IRQ mask.<br><br>Writing“1” to the bit whose corresponding bit in 9C4h for generating interrupt will be masked out.<br><br>Writing“0” to this register does not take any effect. | Yes                  | FFFF_FFFFh |

#### 9.4.257 DOOR BELL IRQ MASK CLEAR REGISTER – OFFSET 9D0h

| BIT  | FUNCTION       | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|----------------|------|--|----------------------|------------|
| 31:0 | Clear IRQ Mask | RW1C | Clear link interface interrupt IRQ mask.<br><br>Writing “1” to the bit whose corresponding bit in 9C4h for generating interrupt will not be masked out.<br><br>Writing“0” to this register does not take any effect. | Yes                  | FFFF_FFFFh |

#### 9.4.258 SCRATCHPAD 0 REGISTER – OFFSET 9E4h

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 0 | RW   | Scratchpad 0 register. | No/Yes               | 0000_0000h |

#### 9.4.259 SCRATCHPAD 1 REGISTER – OFFSET 9E8h

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 1 | RW   | Scratchpad 1 register. | No/Yes               | 0000_0000h |

#### 9.4.260 SCRATCHPAD 2 REGISTER – OFFSET 9ECh

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 2 | RW   | Scratchpad 2 register. | No/Yes               | 0000_0000h |

#### 9.4.261 SCRATCHPAD 3 REGISTER – OFFSET 9F0h

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 3 | RW   | Scratchpad 3 register. | Yes                  | 0000_0000h |

#### 9.4.262 SCRATCHPAD 4 REGISTER – OFFSET 9F4h

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 4 | RW   | Scratchpad 4 register. | No/Yes               | 0000_0000h |

#### 9.4.263 SCRATCHPAD 5 REGISTER – OFFSET 9F8h

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 5 | RW   | Scratchpad 5 register. | No/Yes               | 0000_0000h |

#### 9.4.264 SCRATCHPAD 6 REGISTER – OFFSET 9FCh

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 6 | RW   | Scratchpad 6 register. | No/Yes               | 0000_0000h |

#### 9.4.265 SCRATCHPAD 7 REGISTER – OFFSET A00h

| BIT  | FUNCTION     | TYPE | DESCRIPTION            | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|--------------|------|------------------------|----------------------|------------|
| 31:0 | Scratchpad 7 | RW   | Scratchpad 7 register. | No/Yes               | 0000_0000h |

#### 9.4.266 CDEP DATA 0 REGISTER – OFFSET A04h

| BIT   | FUNCTION          | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------|-------|--|----------------------|---------|
| 7:0   | Bus Number        | RO    | Used to save the bus number for the CDEP.                                    | No                   | 00h     |
| 10:8  | Total Tile Number | RO    | Used to indicate the total tile number.                                      | No                   | 010b    |
| 11    | Reserved          | RsvdP | Not support.   | No                   | 0       |
| 15:12 | Source Domain ID  | RO    | Used to save the source domain id.   | No                   | 0000b   |
| 17:16 | CD Mode           | RO    | Used to save the status for Device Configuration CD Mode.                    | No                   | 00b     |
| 18    | CDEP Status       | RO    | Used to indicate CDEP status<br>1b: CDEP is enabled.<br>0b: CDEP is disabled | No                   | 0       |
| 19    | CDEP Type         | RO    | 0b: CDELP<br>1b: CDVEP   | No                   | 0       |
| 31:20 | Reserved          | RsvdP | Not support.   | No                   | 0-0b    |

#### 9.4.267 CDEP DATA 1 REGISTER – OFFSET A08h

| BIT   | FUNCTION          | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------|-------|--|----------------------|---------|
| 15:0  | R_Host Request ID | RO    | Used to indicate remote host requester ID, which is captured during enumeration.   | No                   | 0000h   |
| 30:16 | Reserved          | RsvdP | Not support.   | No                   | 0000h   |
| 31    | CDEP link enabled | RO    | When set, the link between remote host and CDLEP port is enabled. Once link is up, the configuration and memory commands will be sent to main host via message queue or cross-domain translated transaction. | Yes                  | 0       |

#### 9.4.268 SQ/CQ POINTER CONTROL AND STATUS REGISTER – OFFSET A0Ch

| BIT   | FUNCTION                     | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|-------|--|----------------------|---------|
| 1:0   | SQ Depth                     | RW    | Notify CDLEP the depth of submission queue. The queue is allocated in the physical memory of Main Host.<br>00: 8 entries<br>01: 16 entries<br>10: 32 entries<br>11: Not defined  | No                   | 00b     |
| 6:2   | SQ Tail Index                | RO    | Indicate the current Tail pointer maintained by CDLEP<br>For each transaction met the overlay range and converted into a message going out to Main Host, the index will be increased by one and finally reset to zero after hitting to the SQ depth.   | No                   | 00000b  |
| 10:7  | SQ Buffer Fullness Level     | RO    | Indicate the current fullness level in the SQ buffer located at CDLEP.<br>For any new message that written into the SQ buffer temporarily, the level will be moved up by one. If the message read out from the SQ buffer, the level will be moved down by one. When the value equals to “8h”, it means the SQ buffer is full.  | No                   | 0000b   |
| 15:11 | Reserved                     | RsvdP | Not support.   | No                   | 00h     |
| 19:16 | MMIO_VAL FIFO Fullness Level | RO    | Indicate the current fullness level for MMIO_VAL FIFO located at CDLEP.<br>If the returned CQ message containing MMIO_VAL, it will be stored in the MMIO_VAL FIFO temporarily and the index will be moved up by one. If the message leaving the MMIO_VAL FIFO, the index will be moved down by one. When the value equals to “8h”, it means the MMIO_VAL FIFO is full. | No                   | 0000b   |
| 31:20 | Reserved                     | RsvdP | Not support.   | No                   | 000h    |

#### 9.4.269 SQ TAIL BASE POINTER [31:0] REGISTER – OFFSET A10h

| BIT  | FUNCTION               | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------------------|------|---|----------------------|------------|
| 31:0 | SQ Tail Base Pointer_L | RW   | Point to the tail base location of SQ, bit[31:0].<br>Main Host has to program its SQ tail pointer register, which is the base address of the SQ maintained by Main Host. So the switch can deliver the message to the correct location. | No                   | 0000_0000h |

#### 9.4.270 SQ TAIL BASE POINTER [63:32] REGISTER – OFFSET A14h

| BIT  | FUNCTION               | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------------------|------|---|----------------------|------------|
| 31:0 | SQ Tail Base Pointer_H | RW   | Point to the tail base location of SQ, bit[63:32].<br>Main Host has to program its SQ tail pointer register, which is the base address of the SQ maintained by Main Host. So the switch can | No                   | 0000_0000h |

| BIT | FUNCTION | TYPE | DESCRIPTION                                  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------|------|--|----------------------|---------|
|     |          |      | deliver the message to the correct location. |                      |         |

#### 9.4.271 CQ HEADER LOCATION[31:0] REGISTER – OFFSET A18h

| BIT  | FUNCTION            | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---------------------|------|---|----------------------|------------|
| 31:0 | CQ Header Pointer_L | RW   | Point to location for CQ MMIO, bit[31:0].<br><br>Main Host has to program its CQ header pointer register, which always points to the head of CQ maintained by the switch.<br><br>This pointer must be in sync with one of the CD Port CQ Header locations that belong to the same remote host domain. | No                   | 0000_0000h |

#### 9.4.272 CQ HEADER LOCATION[63:32] REGISTER – OFFSET A1Ch

| BIT  | FUNCTION            | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---------------------|------|--|----------------------|------------|
| 31:0 | CQ Header Pointer_H | RW   | Point to location for CQ MMIO, bit[63:32].<br><br>Main Host has to program its CQ header pointer register, which always points to the head of CQ maintained by the switch. | No                   | 0000_0000h |

#### 9.4.273 UNCORRECTABLE FATAL ERROR LINK RESET REGISTER – OFFSET A28h

| BIT   | FUNCTION                    | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------------|-------|---|----------------------|---------|
| 3:0   | Reserved                    | RsvdP | Not support.  | No                   | 0000b   |
| 4     | Data Link Protocol Error    | RW    | When set, a fatal the Data Link Protocol Error event will reset the link. | Yes                  | 0       |
| 5     | Surprise Down Error         | RW    | When set, a fatal Surprise Down Error event will reset the link.          | Yes                  | 0       |
| 11:6  | Reserved                    | RsvdP | Not support.  | No                   | 0-0b    |
| 12    | Poisoned TLP                | RW    | When set, a fatal DP will reset the link.                                 | Yes                  | 0       |
| 13    | Flow Control Protocol Error | RW    | When set, a fatal Flow Control Protocol Error event will reset the link.  | Yes                  | 0       |
| 14    | Completion Timeout          | RW    | When set, a fatal Completion Timeout event will reset the link.           | Yes                  | 0       |
| 15    | Completer Abort             | RW    | When set, a fatal Completer Abort event will reset the link.              | Yes                  | 0       |
| 16    | Unexpected Completion       | RW    | When set, a fatal Unexpected Completion event will reset the link.        | Yes                  | 0       |
| 17    | Receiver Overflow           | RW    | When set, a fatal Receiver Overflow event will reset the link.            | Yes                  | 0       |
| 18    | Malformed TLP               | RW    | When set, a fatal event of Malformed TLP will reset the link.             | Yes                  | 0       |
| 19    | ECRC Error                  | RW    | When set, a fatal event of ECRC Error will reset the link.                | Yes                  | 0       |
| 20    | Unsupported Request Error   | RW    | When set, a fatal Unsupported Request even will reset the link.           | Yes                  | 0       |
| 21    | ACS Violation               | RW    | When set, a fatal ACS even will reset the link.                           | Yes                  | 0       |
| 22    | Internal Error              | RW    | When set, a fatal Internal Error event will reset the link.               | Yes                  | 0       |
| 23    | MC Blocked TLP              | RW    | When set, a fatal MC Blocked TLP event will reset the link.               | Yes                  | 0       |
| 24    | AtomicOp Egress Blocked     | RW    | When set, a fatal AtomicOp Egress Blocked event will reset the link.      | Yes                  | 0       |
| 31:25 | Reserved                    | RsvdP | Not support.  | No                   | 0       |

#### 9.4.274 SYNC. CDVEP UNCORRECTABLE ERROR STATUS REGISTER – OFFSET A2Ch

#### 9.4.275 Source ID LUT 0 – 7 – OFFSET A80h to A9Ch

These 8 32-bit registers construct a Source ID look-up table storing the ID pointed to the switch where the requester is located at. Also, there are two bits of each entry to indicate if the requester is an embedded DMA function. The table content is programmed by management CPU. These 8 entries identified by index numbers (0 ~ 7) represent the distinct Source ID and the associated DMA attributes.

**Table 9-8 5-Bit Synthesized ID LUT Entry 0-15 Register Locations**

| CFG_OFFSET | STID LUT Entry_n |
|------------|------------------|
| A80h       | 0                |
| A84h       | 1                |
| A88h       | 2                |

## 9.5 CDVEP CONFIGURATION REGISTERS

When the port of the Switch is set to operate at cross-domain end point mode, it is represented by an Other Bridge that implements type 0 configuration space header. The following table details the allocation of the register fields of the PCI 2.3 compatible type 1 configuration space header.

| 31 – 24   | 23 – 16                                | 15 – 8                                    | 7 – 0   | BYTE OFFSET |
|---|--|---|---|-------------|

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

### 9.5.1 VENDOR ID REGISTER – OFFSET 00h

| BIT  | FUNCTION  | TYPE | DESCRIPTION                                      | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------|------|--|----------------------|---------|
| 15:0 | Vendor ID | RO   | Identifies Pericom as the vendor of this device. | Yes                  | 12D8h   |

### 9.5.2 DEVICE ID REGISTER – OFFSET 00h

| BIT   | FUNCTION  | TYPE | DESCRIPTION                                | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------|------|--|----------------------|---------|
| 31:16 | Device ID | RO   | Identifies this device as the PI7C9X3G816. | Yes                  | C016h   |

### 9.5.3 COMMAND REGISTER – OFFSET 04h

| BIT | FUNCTION         | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|------------------|------|---|----------------------|---------|
| 0   | I/O Space Enable | RW   | 0b: Ignores I/O transactions on the primary interface<br>1b: Enables responses to I/O transactions on the primary interface | No/Yes               | 0       |

| BIT   | FUNCTION                           | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|-------|--|----------------------|---------|
| 1     | Memory Space Enable                | RW    | 0b: Ignores memory transactions on the primary interface<br>1b: Enables responses to memory transactions on the primary interface  | No/Yes               | 0       |
| 2     | Bus Master Enable                  | RW    | 0b: Does not initiate memory or I/O transactions on the upstream port and handles asan Unsupported Request (UR) to memory and I/O transactions on the downstream port. For Non-Posted Requests, a completion with UR completion status must be returned<br>1b: Enables the Switch Port to forward memory and I/O Read/Write transactions in the upstream direction | No/Yes               | 0       |
| 3     | Special Cycle Enable               | RsvdP | Not support.   | No                   | 0       |
| 4     | Memory Write And Invalidate Enable | RsvdP | Not support.   | No                   | 0       |
| 5     | VGA Palette Snoop Enable           | RsvdP | Not support.   | No                   | 0       |
| 6     | Parity Error Response Enable       | RW    | 0b: Switch may ignore any parity errors that it detects and continue normal operation<br>1b: Switch must take its normal action when a parity error is detected  | No/Yes               | 0       |
| 7     | Wait Cycle Control                 | RsvdP | Not support.   | No                   | 0       |
| 8     | SERR# enable                       | RW    | 0b: Disables the reporting of Non-fatal and Fatal errors detected by the Switch to the Root Complex<br>1b: Enables the Non-fatal and Fatal error reporting to Root Complex   | No/Yes               | 0       |
| 9     | Fast Back-to-Back Enable           | RsvdP | Not support.   | No                   | 0       |
| 10    | Interrupt Disable                  | RW    | Controls the ability of a PCI Express device to generate INTx Interrupt Messages. In the Switch, this bit does not affect the forwarding of INTx messages from the downstream ports.   | No/Yes               | 0       |
| 15:11 | Reserved                           | RsvdP | Not support.   | No                   | 0000_0b |

#### 9.5.4 PRIMARY STATUS REGISTER – OFFSET 04h

| BIT   | FUNCTION                  | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------|-------|---|----------------------|---------|
| 18:16 | Reserved                  | RsvdP | Not support.  | No                   | 000b    |
| 19    | Interrupt Status          | RO    | Indicates that an INTx Interrupt Message is pending internally to the device.<br>In the Switch, the forwarding of INTx messages from the downstream device of the Switch port is not reflected in this bit. Must be hardwired to 0. | No                   | 0       |
| 20    | Capabilities List         | RO    | Set to 1b to enable support for the capability list (offset 34h is the pointer to the data structure).  | Yes/No               | 1       |
| 21    | 66MHz Capable             | RO    | Does not apply to PCI Express. Must be hardwired to 0.  | No                   | 0       |
| 22    | Reserved                  | RsvdP | Not support.  | No                   | 0       |
| 23    | Fast Back-to-Back Capable | RsvdP | Not support.  | No                   | 0       |
| 24    | Master Data Parity Error  | RW1C  | Set to 1b (by a requester) whenever a Parity error is detected or forwarded on the primary side of the port in a Switch.<br><br>If the Parity Error Response Enable bit is cleared, this bit is never set.                          | No/Yes               | 0       |
| 26:25 | DEVSEL# timing            | RsvdP | Not support.  | No                   | 00b     |
| 27    | Signaled Target Abort     | RW1C  | This bit is Set when the Secondary Side for Type 1 Configuration Space header Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted Request as a Completer Abort error.           | No/Yes               | 0       |
| 28    | Received Target Abort     | RsvdP | Not support.  | No                   | 0       |
| 29    | Received Master Abort     | RsvdP | Not support.  | No                   | 0       |
| 30    | Signaled System Error     | RW1C  | Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR Enable bit in the Command register is 1b.  | No/Yes               | 0       |

| BIT | FUNCTION              | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-----------------------|------|--|----------------------|---------|
| 31  | Detected Parity Error | RW1C | Set to 1b whenever the primary side of the port in a Switch receives a Poisoned TLP. | No/Yes               | 0       |

### 9.5.5 REVISION ID REGISTER – OFFSET 08h

| BIT | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------|------|--------------------------------------|----------------------|---------|
| 7:0 | Revision | RO   | Indicates revision number of device. | Yes                  | 6h      |

### 9.5.6 CLASS REGISTER – OFFSET 08h

| BIT   | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|------|---|----------------------|---------|
| 15:8  | Programming Interface | RO   | Read as 00h to indicate no programming interfaces have been defined for PCI-to-PCI Bridges. | Yes/No               | 00h     |
| 23:16 | Sub-Class Code        | RO   | Read as 04h to indicate device is an Other Bridge.  | Yes/No               | 80h     |
| 31:24 | Base Class Code       | RO   | Read as 06h to indicate device is a Bridge device.  | Yes/No               | 06h     |

### 9.5.7 CACHE LINE REGISTER – OFFSET 0Ch

| BIT | FUNCTION        | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-----------------|------|---|----------------------|---------|
| 7:0 | Cache Line Size | RW   | The cache line size register is set by the system firmware and the operating system cache line size. This field is implemented by PCI Express devices as a RW field for legacy compatibility, but it has no impact on any PCI Express device functionality. | No/Yes               | 00h     |

### 9.5.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

| BIT  | FUNCTION              | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------------|-------|--------------|----------------------|---------|
| 15:8 | Primary Latency Timer | RsvdP | Not support. | No                   | 00h     |

### 9.5.9 HEADER TYPE REGISTER – OFFSET 0Ch

| BIT   | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|------|---|----------------------|---------|
| 22:16 | Header Type           | RO   | To indicate that the register layout confirms to Type 0 Configuration Header for CDVEP. | No                   | 00h     |
| 23    | Multi-Function Device | RO   | 0b: Single function device<br>1b: Multiple functions device                             | No                   | 0       |

### 9.5.10 BAR 0 REGISTER – OFFSET 10h

| BIT   | FUNCTION               | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|-------|--|----------------------|---------|
| 0     | Memory Space Indicator | RO    | Reset to 0b to indicate Memory Base address.                         | No                   | 0       |
| 2:1   | 64-bit Addressing      | RO    | 00b: 32-bit addressing<br>10b: 64-bit addressing<br>Others: Reserved | No                   | 00b     |
| 3     | Prefetchable           | RO    | 0b: Non-prefetchable<br>1b: Prefetchable                             | No                   | 0       |
| 18:4  | Reserved               | RsvdP | Not support.   | No                   | 0-0h    |
| 31:19 | Base Address 0 [31:19] | RW    | Use this Memory base address to map the packet switch registers.     | No/Yes               | 0-0h    |

### 9.5.11 BAR 1 REGISTER – OFFSET 14h

| BIT  | FUNCTION              | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------------------|------|--|----------------------|------------|
| 31:0 | Reserved              | RO   | When the Base Address 0 register is not 64-bit addressing ( <a href="#">offset 10h[2:1]</a> is not 10b).   | No                   | 0000_0000h |
|      | Base Address 1 [31:0] | RW   | When the Base Address 0 register is 64-bit addressing. Base Address 1 is used to provide the upper 32 Address bits when <a href="#">offset 10h[2:1]</a> is set to 10b. | No/Yes               |            |

### 9.5.12 BAR 2 REGISTER – OFFSET 18h

| BIT   | FUNCTION               | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|-------|---|----------------------|---------|
| 0     | Memory Space Indicator | RO    | Reset to 0b to indicate it is a Memory BAR.   | No                   | 0       |
| 2:1   | Memory Map Type        | RO    | 00b: support 32-bit Memory Space<br>10b: support 64-bit Memory Space<br><br>When 64-bit memory space is supported, the assigned memory address has to be larger than 4GB. | No                   | 00b     |
| 3     | Prefetchable           | RO    | 0b: Non-prefetchable<br>1b: Prefetchable  | No                   | 0       |
| 19:4  | Reserved               | RsvdP | Not support.  | No                   | 0-0h    |
| 31:20 | Base Address 2 [31:20] | RW    | Base Address 2.   | No/Yes               | 000h    |

### 9.5.13 BAR 3 REGISTER – OFFSET 1Ch

| BIT  | FUNCTION               | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|------------------------|-------|--|----------------------|-----------|
| 0    | Memory Space Indicator | RO    | When <a href="#">offset 18h[2:1]</a> =00b, BAR 3 is used as an independent 32-bit BAR.<br>Reset to 0b to indicate it is a Memory BAR.                          | No                   | 0         |
|      | Base Address 2 [32]    | RW    | When <a href="#">offset 18h[2:1]</a> =10b, BAR 3 is used as the upper 32 bits of 64-bit BAR 2/3.   | No/Yes               | 0         |
| 2:1  | Memory Map Type        | RO    | When <a href="#">offset 18h[2:1]</a> =00b, BAR 3 is used as an independent 32-bit BAR.<br>00b: support 32-bit Memory Space<br>10b: support 64-bit Memory Space | No                   | 00b       |
|      | Base Address 2 [34:33] | RW    | When <a href="#">offset 18h[2:1]</a> =10b, BAR 3 is used as the upper 32 bits of 64-bit BAR 2/3.   | No/Yes               | 00b       |
| 3    | Prefetchable           | RO    | When <a href="#">offset 18h[2:1]</a> =00b, BAR 3 is used as an independent 32-bit BAR.<br>0b: Non-prefetchable<br>1b: Prefetchable                             | No                   | 0         |
|      | Base Address 2 [35]    | RW    | When <a href="#">offset 18h[2:1]</a> =10b, BAR 3 is used as the upper 32 bits of 64-bit BAR 2/3.   | No/Yes               | 0         |
| 31:4 | Base Address 3 [31:4]  | RsvdP | When <a href="#">offset 18h[2:1]</a> =00b, BAR 3 is used as an independent 32-bit BAR.   | No                   | 0000_000h |
|      | Base Address 2 [63:36] | RW    | When <a href="#">offset 18h[2:1]</a> =10b, BAR 3 is used as the upper 32 bits of 64-bit BAR 2/3.   | No/Yes               | 0000_000h |

### 9.5.14 BAR 4 REGISTER – OFFSET 20h

| BIT   | FUNCTION               | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|-------|---|----------------------|---------|
| 0     | Memory Space Indicator | RO    | Reset to 0b to indicate it is a Memory BAR.   | No                   | 0       |
| 2:1   | Memory Map Type        | RO    | 00b: support 32-bit Memory Space<br>10b: support 64-bit Memory Space<br><br>When 64-bit memory space is supported, the assigned memory address has to be larger than 4GB. | No                   | 00b     |
| 3     | Prefetchable           | RO    | 0b: Non-prefetchable<br>1b: Prefetchable  | No                   | 0       |

| 31:20 | Base Address 4 [31:20] | RW    | Base Address 4.   | No/Yes               | 000h    |

### 9.5.15 BAR 5 REGISTER – OFFSET 24h

| BIT  | FUNCTION               | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|------------------------|-------|--|----------------------|-----------|
| 0    | Memory Space Indicator | RO    | When <a href="#">offset 20h[2:1]</a> =00b, BAR 5 is used as an independent 32-bit BAR.   | No                   | 0         |
|      | Base Address 4 [32]    | RW    | When <a href="#">offset 20h[2:1]</a> =10b, BAR 5 is used as the upper 32 bits of 64-bit BAR 4/5.   | No/Yes               | 0         |
| 2:1  | Memory Map Type        | RO    | When <a href="#">offset 20h[2:1]</a> =00b, BAR 5 is used as an independent 32-bit BAR.<br><br>00b: support 32-bit Memory Space<br>10b: support 64-bit Memory Space | No                   | 00b       |
|      | Base Address 4 [34:33] | RW    | When <a href="#">offset 20h[2:1]</a> =10b, BAR 5 is used as the upper 32 bits of 64-bit BAR 2/3.   | No/Yes               | 00b       |
| 3    | Prefetchable           | RO    | When <a href="#">offset 20h[2:1]</a> =00b, BAR 5 is used as an independent 32-bit BAR.<br><br>0b: Non-prefetchable<br>1b: Prefetchable                             | No                   | 0         |
|      | Base Address 4 [35]    | RW    | When <a href="#">offset 20h[2:1]</a> =10b, BAR 5 is used as the upper 32 bits of 64-bit BAR 2/3.   | No/Yes               | 0         |
| 31:4 | Base Address 5 [31:4]  | RsvdP | When <a href="#">offset 20h[2:1]</a> =00b, BAR 5 is used as an independent 32-bit BAR.   | No                   | 0000_000h |
|      | Base Address 4 [63:36] | RW    | When <a href="#">offset 20h[2:1]</a> =10b, BAR 5 is used as the upper 32 bits of 64-bit BAR 4/5.   | No/Yes               | 0000_000h |

### 9.5.16 SSVID REGISTER – OFFSET 2Ch

| BIT  | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------|------|--------------------------------------|----------------------|---------|
| 15:0 | SSVID    | RO   | Identifies the sub-system vendor id. | Yes                  | 12D8h   |

### 9.5.17 SSID REGISTER – OFFSET 2Ch

| BIT   | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------|------|--------------------------------------|----------------------|---------|
| 31:16 | SSID     | RO   | Identifies the sub-system device id. | Yes                  | C016h   |

### 9.5.18 CAPABILITY POINTER REGISTER – OFFSET 34h

| BIT | FUNCTION           | TYPE | DESCRIPTION                              | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------|------|--|----------------------|---------|
| 7:0 | Capability Pointer | RO   | Point to first PCI capability structure. | Yes/No               | 40h     |

### 9.5.19 INTERRUPT LINE REGISTER – OFFSET 3Ch

| BIT | FUNCTION       | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------|------|--|----------------------|---------|
| 7:0 | Interrupt Line | RW   | The interrupt line register communicates interrupt line routing information. | No/Yes               | 00h     |

### 9.5.20 INTERRUPT PIN REGISTER – OFFSET 3Ch

| BIT  | FUNCTION      | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------|------|---|----------------------|---------|
| 15:8 | Interrupt Pin | RO   | The Switch implements INTA virtual wire interrupt signalsto represent hot-plug events at downstream ports.<br>0b: disable INTA<br>1b: enable INTA | Yes/No               | 1h      |

### 9.5.21 POWER MANAGEMENT CAPABILITIES REGISTER – OFFSET 40h

| BIT   | FUNCTION                       | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------|-------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID       | RO    | Read as 01h to indicate that this is power management capability register.   | Yes/No               | 01h     |
| 15:8  | Next Item Pointer              | RO    | Point to next PCI capability structure.  | Yes/No               | 48h     |
| 18:16 | Power Management Revision      | RO    | Read as 011b to indicate the device is compliant to Revision 1.2 of <i>PCI Power Management Interface Specifications</i> . | No                   | 011b    |
| 19    | PME# Clock                     | RO    | Does not apply to PCI Express. Must be hardwired to 0.   | No                   | 0       |
| 20    | Reserved                       | RsvdP | Not support.   | No                   | 0       |
| 21    | Device specific Initialization | RO    | Read as 0b to indicate Switch does not have device specific initialization requirements.                                   | Yes/No               | 0       |
| 24:22 | AUX Current                    | RO    | To indicate aux current.   | Yes/No               | 000b    |
| 25    | D1 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D1 power management state.  | Yes/No               | 0       |
| 26    | D2 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D2 power management state.  | Yes/No               | 0       |
| 31:27 | PME# Support                   | RO    | Read as 19h to indicate Switch supports the forwarding of PME# message in D0, D3 and D4 states.                            | Yes/No               | 00h     |

### 9.5.22 POWER MANAGEMENT DATA REGISTER – OFFSET 44h

| BIT | FUNCTION    | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-------------|------|--|----------------------|---------|
| 1:0 | Power State | RW   | Indicates the current power state of the Switch. Writing a value of D0 when the previous state was D3 cause a hot reset without asserting DWRST_L.<br>00b: D0 state<br>01b: D1 state<br>10b: D2 state<br>11b: D3 hot state | No/Yes               | 00b     |

| BIT   | FUNCTION      | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|-------|--|----------------------|---------|
| 2     | Reserved      | RsvdP | Not support.   | No                   | 0       |
| 3     | No_Soft_Reset | RO    | When set, this bit indicates that device transitioning from D3hot to D0 does not perform an internal reset. When clear, an internal reset is performed when power state transits from D3hot to D0. | Yes/No               | 1       |
| 7:4   | Reserved      | RsvdP | Not support.   | No                   | 0h      |
| 8     | PME# Enable   | RW    | When asserted, the Switch will generate the PME# message.  | No                   | 0       |
| 12:9  | Data Select   | RO    | Select data registers.   | No                   | 0h      |
| 14:13 | Data Scale    | RO    | Reset to 00b.  | No                   | 00b     |
| 15    | PME Status    | RW1C  | Read as 0b as the PME# message is not implemented.   | No                   | 0       |

### 9.5.23 PPB SUPPORT EXTENSIONS REGISTER – OFFSET 44h

| BIT   | FUNCTION                         | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------------|-------|--------------|----------------------|---------|
| 21:16 | Reserved                         | RsvdP | Not support. | No                   | 00h     |
| 22    | B2_B3 Support for D3HOT          | RsvdP | Not support. | No                   | 0       |
| 23    | Bus Power / Clock Control Enable | RsvdP | Not support. | No                   | 0       |

### 9.5.24 DATA REGISTER– OFFSET 44h

| BIT   | FUNCTION      | TYPE | DESCRIPTION    | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|------|----------------|----------------------|---------|
| 31:24 | Data Register | RO   | Data Register. | Yes/No               | 00h     |

| BIT   | FUNCTION                   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------|------|---|----------------------|---------|
| 7:0   | Enhanced Capabilities ID   | RO   | Read as 05h to indicate that this is message signal interrupt capability register.  | No                   | 05h     |
| 15:8  | Next Item Pointer          | RO   | Point to next PCI capability structure.   | Yes/No               | 68h     |
| 16    | MSI Enable                 | RW   | 0b: The function is prohibited from using MSI to request service<br>1b: The function is permitted to use MSI to request service and is prohibited from using its INTx # pin | No/Yes               | 0       |
| 19:17 | Multiple Message Capable   | RO   | Indicate the number of requested vectors.   | Yes                  | 010b    |
| 22:20 | Multiple Message Enable    | RW   | Software writes to this field to indicate the number of allocated vectors (equal to or less than the number of requested vectors.)  | No/Yes               | 000b    |
| 23    | 64-bit address capable     | RO   | 0b: The function is not capable of generating a 64-bit message address<br>1b: The function is capable of generating a 64-bit message address                                | Yes                  | 1b      |
| 24    | Pre-vector Masking Capable | RW   | 1b: the function supports MSI pre-vector masking.<br>0b: the function does Not support MSI pre-vector masking.  | No/Yes               | 0b      |
| 31:25 | Reserved                   | RO   | Not support.  | No                   | 00h     |

### 9.5.26 MESSAGE ADDRESS REGISTER – OFFSET 4Ch

| BIT  | FUNCTION        | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------|-------|---|----------------------|---------|
| 1:0  | Reserved        | RsvdP | Not support.  | No                   | 00b     |
| 31:2 | Message Address | RW    | If the message enable bit is set, the contents of this register specify the DWORD aligned address for MSI memory write transaction. | No/Yes               | 0-0h    |

### 9.5.27 MESSAGE UPPER ADDRESS REGISTER – OFFSET 50h

| BIT  | FUNCTION      | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|---------------|------|---|----------------------|------------|
| 31:0 | Message Upper | RW   | This register is only effective if the device supports a 64-bit | No/Yes               | 0000_0000h |

| BIT | FUNCTION | TYPE | DESCRIPTION             | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------|------|-------------------------|----------------------|---------|
|     | Address  |      | message address is set. |                      |         |

### 9.5.28 MESSAGE DATA REGISTER – OFFSET 54h

| BIT  | FUNCTION     | TYPE | DESCRIPTION | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|--------------|------|-------------|----------------------|---------|
| 15:0 | Message Data | RW   | Reset to 0. | No/Yes               | 0000h   |

### 9.5.29 MESSAGE MASK REGISTER – OFFSET 58h

| BIT  | FUNCTION                  | TYPE  | DESCRIPTION                       | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|---------------------------|-------|-----------------------------------|----------------------|-----------|
| 0    | MSI Mask for Hot Plug     | RW    | MSI mask for Hot Plug interrupts. | No/Yes               | 0         |
| 1    | MSI Mask for DPC          | RW    | MSI mask for DPC interrupts.      | No/Yes               | 0         |
| 2    | MSI Mask for DMA and GPIO | RW    | MSI mask for DMAGPIO interrupts.  | No/Yes               | 0         |
| 3    | MSI Mask for CDEP         | RW    | MSI mask for CDEP interrupts.     | No/Yes               | 0         |
| 31:4 | Reserved                  | RsvdP | Not support.                      | No                   | 0000_000h |

### 9.5.30 MESSAGE PENDING REGISTER – OFFSET 5Ch

| BIT  | FUNCTION                            | TYPE  | DESCRIPTION                                 | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|------|-------------------------------------|-------|---|----------------------|-----------|
| 0    | MSI Pending for Hot Plug Interrupts | RO    | MSI pending status for Hot Plug interrupts. | No                   | 0         |
| 1    | MSI Pending for DPC Interrupts      | RO    | MSI pending status for DPC interrupts.      | No                   | 0         |
| 2    | MSI Pending for GPIO Interrupts     | RO    | MSI pending status for GPIO interrupts.     | No                   | 0         |
| 3    | MSI Pending for CDEP Interrupts     | RO    | MSI pending status for CDEP interrupts.     | No                   | 0         |
| 31:4 | Reserved                            | RsvdP | Not support.                                | No                   | 0000_000h |

### 9.5.31 PCI EXPRESS CAPABILITIES REGISTER – OFFSET 68h

| BIT   | FUNCTION                 | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|-------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID | RO    | Read as 10h to indicate that this is PCI express capability register.  | No                   | 10h     |
| 15:8  | Next Item Pointer        | RO    | Point to next PCI capability structure.  | Yes/No               | A4h     |
| 19:16 | Capability Version       | RO    | Read as 2h to indicate the device is compliant to Revision .2.0 of <i>PCI Express Base Specifications</i> .                                      | Yes/No               | 2h      |
| 23:20 | Device/Port Type         | RO    | Indicates the type of PCI Express logical device.  | Yes/No               | 0h      |
| 24    | Slot Implemented         | RO    | When set, indicates that the PCIe Link associated with this Port is connected to a slot. This field is valid for downstream ports of the Switch. | Yes/No               | 0       |
| 29:25 | Interrupt Message Number | RO    | Read as 0. No MSI messages are generated in the transparent mode.  | No                   | 00_000b |
| 31:30 | Reserved                 | RsvdP | Not support.   | No                   | 00b     |

### 9.5.32 DEVICE CAPABILITIES REGISTER – OFFSET 6Ch

| BIT | FUNCTION                   | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------------------|------|---|----------------------|---------|
| 2:0 | Max_Payload_Size Supported | RO   | Indicates the maximum payload size that the device can support for TLPs. Each port of the Switch supports 512 bytes max payload size. | Yes/No               | 010b    |

| BIT   | FUNCTION                        | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------------|-------|--|----------------------|---------|
| 4:3   | Phantom Functions Supported     | RO    | Indicates the support for use of unclaimed function numbers as Phantom functions. Read as 00b, since the Switch does not act as a requester.   | No                   | 00b     |
| 5     | Extended Tag Field Supported    | RO    | Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the Switch does not act as a requester.   | No                   | 1       |
| 8:6   | Reserved                        | RsvdP | Not support.   | No                   | 111b    |
| 11:9  | Reserved                        | RsvdP | Not support.   | No                   | 111b    |
| 14:12 | Reserved                        | RsvdP | Not support.   | No                   | 000b    |
| 15    | Role_Based Error Reporting      | RO    | When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN.  | Yes/No               | 1       |
| 17:16 | Reserved                        | RsvdP | Not support.   | No                   | 00b     |
| 25:18 | Captured Slot Power Limit Value | RO    | In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00h. | No                   | 00h     |
| 27:26 | Captured Slot Power Limit Scale | RO    | Specifies the scale used for the Slot Power Limit Value.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00b.   | No                   | 00b     |
| 31:28 | Reserved                        | RsvdP | Not support.   | No                   | 0h      |

### 9.5.33 DEVICE CONTROL REGISTER – OFFSET 70h

| BIT   | FUNCTION                             | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------------|-------|--|----------------------|---------|
| 0     | Correctable Error Reporting Enable   | RW    | 0b: Disable Correctable Error Reporting<br>1b: Enable Correctable Error Reporting  | No/Yes               | 0       |
| 1     | Non-Fatal Error Reporting Enable     | RW    | 0b: Disable Non-Fatal Error Reporting<br>1b: Enable Non-Fatal Error Reporting  | No/Yes               | 0       |
| 2     | Fatal Error Reporting Enable         | RW    | 0b: Disable Fatal Error Reporting<br>1b: Enable Fatal Error Reporting  | No/Yes               | 0       |
| 3     | Unsupported Request Reporting Enable | RW    | 0b: Disable Unsupported Request Reporting<br>1b: Enable Unsupported Request Reporting  | No/Yes               | 0       |
| 4     | Enable Relaxed Ordering              | RO    | When set, it permits the device to set the Relaxed Ordering bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.   | No                   | 0       |
| 7:5   | Max_Payload_Size                     | RW    | This field sets maximum TLP payload size for the device. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported in the Device Capabilities register. Any value exceeding the Max_Payload_Size Supported written to this register results into clamping to the Max_Payload_Size Supported value. | No/Yes               | 000b    |
| 8     | Extended Tag Field Enable            | RW    | When set, this bit enables a function to use an 8-bit Tag field as a requester. If the bit is clear, the function is restricted to a 5-bit Tag field.  | No/Yes               | 0       |
| 9     | Reserved                             | RsvdP | Not support.   | No                   | 0       |
| 10    | Auxiliary (AUX) Power PM Enable      | RO    | When set, indicates that a device is enabled to draw AUX power independent of PME AUX power.   | No                   | 0       |
| 11    | Enable No Snoop                      | RO    | When set, it permits to set the No Snoop bit in the attribute field of transaction. Since the Switch can not either act as a requester or alter the content of packet it forwards, this bit always returns '0' when read.  | No                   | 0       |
| 14:12 | Max_Read_Request_Size                | RO    | This field sets the maximum Read Request size for the device as a Requester. Since the Switch does not generate read request by itself, these bits are hardwired to 0.   | No                   | 000b    |
| 15    | Reserved                             | RsvdP | Not support.   | No                   | 0       |

### 9.5.34 DEVICE STATUS REGISTER – OFFSET 70h

| BIT   | FUNCTION                     | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------|-------|---|----------------------|---------|
| 16    | Correctable Error Detected   | RW1C  | Asserted when correctable error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.   | No/Yes               | 0       |
| 17    | Non-Fatal Error Detected     | RW1C  | Asserted when non-fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.     | No/Yes               | 0       |
| 18    | Fatal Error Detected         | RW1C  | Asserted when fatal error is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.         | No/Yes               | 0       |
| 19    | Unsupported Request Detected | RW1C  | Asserted when unsupported request is detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. | No/Yes               | 0       |
| 20    | AUX Power Detected           | RO    | Asserted when the AUX power is detected by the Switch   | No                   | 0       |
| 21    | Transactions Pending         | RO    | Each port of Switch does not issue Non-posted Requests on its own behalf, so this bit is hardwired to 0b.   | No                   | 0       |
| 31:22 | Reserved                     | RsvdP | Not support.  | No                   | 0-0h    |

### 9.5.35 LINK CAPABILITIES REGISTER – OFFSET 74h

| BIT   | FUNCTION                                     | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT                              |
|-------|--|-------|---|----------------------|--------------------------------------|
| 3:0   | Maximum Link Speed                           | RO    | Indicates the maximum speed of the Express link is 8Gb/s, 5Gb/s and 2.5 Gb/s.<br>0001b: 2.5 Gb/s<br>0010b: 5.0 Gb/s<br>0011b: 8.0 Gb/s<br>Others: Reserved  | Yes/No               | 2h                                   |
| 9:4   | Maximum Link Width                           | RO    | Indicates the maximum width of the given PCIe Link. Valid widths are x1, x2 or x4 which are set by <a href="#">PORTCFG[2:0]</a> strap pins. Please refer to Table 5-1<br>00_0001b: x1 lane width<br>00_0010b: x2 lane width<br>00_0100b: x4 lane width<br>00_1000b: x8 lane width | Yes                  | Set by <a href="#">PORTCFG [2:0]</a> |
| 11:10 | Active State Power Management (ASPM) Support | RO    | Indicates the level of ASPM supported on the given PCIe Link. Each port of Switch supports L0s and L1 entry.<br><br>The switch does not support ASPM function. Please set 00b by eeprom.  | Yes/No               | 10b                                  |
| 14:12 | L0s Exit Latency                             | RO    | Indicates the L0s exit latency for the given PCIe Link. The length of time this port requires to complete transition from L0s to L0 is in the range of 256ns to less than 512ns.  | Yes/No               | 011b                                 |
| 17:15 | L1 Exit Latency                              | RO    | Indicates the L1 exit latency for the given PCIe Link. The length of time this port requires to complete transition from L1 to L0 is less than 1us.   | Yes/No               | 000b                                 |
| 18    | Clock Power Management                       | RsvdP | Not support.  | No                   | 0                                    |

### 9.5.74 ADDRESS LUT ACCESS DATA 0 REGISTER – OFFSET 91Ch

| BIT   | FUNCTION          | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------------|-------|--|----------------------|---------|
| 0     | 3DW Address Space | RW    | 0b: the translated TLP header is in 4DW format<br>1b: the translated TLP header is in 3DW format | Yes                  | 0       |
| 4:1   | Domain ID         | RW    | Used to indicate the domain id.  | Yes                  | 0000b   |
| 12:5  | Reserved          | RsvdP | Not support.   | No                   | 0-0b    |
| 31:13 | LUT Data[31:13]   | RW    | Used to indicate LUT Data[31:13].  | Yes                  | 0000_0h |

### 9.5.75 ADDRESS LUT ACCESS DATA 1 REGISTER – OFFSET 920h

| BIT  | FUNCTION        | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------------|------|---|----------------------|------------|
| 31:0 | LUT HData[31:0] | RW   | Used to indicate the higher 32-bit destination base address in 64-bit address domain. | Yes                  | 0000_0000h |

### 9.5.76 ID/DOMAIN LUT 0 – 15– OFFSET 924h to 960h

These 16 32-bit registers construct a Requester ID (RID) look-up table storing the RID of TLP issued from Main Host, which connected to the upstream port directly. The table content can be either built by hardware automatically or written by software of management CPU. There are control signals defined in the 14<sup>th</sup> and 15<sup>th</sup> bits of [Device Configuration 2 Register at offset 50Ch of Port 0](#) to decide RID LUT build-up mechanism for CDVEP P0 and CDLEP P4 respectively.

**Table 9-10 16-Bit ID/Domain LUT Entry 0-15 Register Locations**

| CFG_OFFSET | ID/DomainLUT Entry_n | CFG_OFFSET | ID/Domain LUT Entry_n |
|------------|----------------------|------------|-----------------------|
| 924h       | 0                    | 944h       | 8                     |
| 928h       | 1                    | 948h       | 9                     |
| 92Ch       | 2                    | 94Ch       | 10                    |
| 930h       | 3                    | 950h       | 11                    |
| 934h       | 4                    | 954h       | 12                    |
| 938h       | 5                    | 958h       | 13                    |

Other than the PCI 2.3 compatible configuration space header, the Switch also implements PCI express extended configuration space header, which includes advanced error reporting, virtual channel, and power budgeting capability registers. The following table details the allocation of the register fields of PCI express extended capability space header. The first extended capability always begins at offset 100h with a PCI Express Enhanced Capability header and the rest of capabilities are located at an offset greater than 0FFh relative to the beginning of PCI compatible configuration space.

| 31 – 24  | 23 – 16 | 15 - 8                       | 7 – 0  | BYTE OFFSET |
|--|---------|------------------------------|--|-------------|

### 9.6.1 VENDOR ID REGISTER – OFFSET 00h

| BIT  | FUNCTION  | TYPE | DESCRIPTION                                      | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------|------|--|----------------------|---------|
| 15:0 | Vendor ID | RO   | Identifies Pericom as the vendor of this device. | No                   | 12D8h   |

### 9.6.2 DEVICE ID REGISTER – OFFSET 00h

| BIT   | FUNCTION  | TYPE | DESCRIPTION                                | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------|------|--|----------------------|---------|
| 31:16 | Device ID | RO   | Identifies this device as the PI7C9X3G816. | No                   | C016h   |

### 9.6.3 COMMAND REGISTER – OFFSET 04h

| BIT   | FUNCTION                           | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------------------|-------|--|----------------------|---------|
| 0     | I/O Space Enable                   | RW    | 0b: Ignores I/O transactions on the primary interface<br>1b: Enables responses to I/O transactions on the primary interface  | No                   | 0       |
| 1     | Memory Space Enable                | RW    | 0b: Ignores memory transactions on the primary interface<br>1b: Enables responses to memory transactions on the primary interface  | No                   | 0       |
| 2     | Bus Master Enable                  | RW    | 0b: Does not initiate memory or I/O transactions on the upstream port and handles asan Unsupported Request (UR) to memory and I/O transactions on the downstream port. For Non-Posted Requests, a completion with UR completion status must be returned<br>1b: Enables the Switch Port to forward memory and I/O Read/Write transactions in the upstream direction | No                   | 0       |
| 3     | Special Cycle Enable               | RsvdP | Not support.   | No                   | 0       |
| 4     | Memory Write And Invalidate Enable | RsvdP | Not support.   | No                   | 0       |
| 5     | VGA Palette Snoop Enable           | RsvdP | Not support.   | No                   | 0       |
| 6     | Parity Error Response Enable       | RW    | 0b: Switch may ignore any parity errors that it detects and continue normal operation<br>1b: Switch must take its normal action when a parity error is detected  | No                   | 0       |
| 7     | Wait Cycle Control                 | RsvdP | Not support.   | No                   | 0       |
| 8     | SERR# enable                       | RW    | 0b: Disables the reporting of Non-fatal and Fatal errors detected by the Switch to the Root Complex<br>1b: Enables the Non-fatal and Fatal error reporting to Root Complex   | No                   | 0       |
| 9     | Fast Back-to-Back Enable           | RsvdP | Not support.   | No                   | 0       |
| 10    | Interrupt Disable                  | RW    | 0b: Enable to generate INTx Interrupt Messages<br>1b: Disable to generate INTx Interrupt Messages  | No                   | 0       |
| 15:11 | Reserved                           | RsvdP | Not support.   | No                   | 0000_0b |

### 9.6.4 PRIMARY STATUS REGISTER – OFFSET 04h

| BIT   | FUNCTION         | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------|-------|--|----------------------|---------|
| 18:16 | Reserved         | RsvdP | Not support.   | No                   | 000b    |
| 19    | Interrupt Status | RO    | Indicates that an INTx Interrupt Message is pending internally to the device. In the Switch, the forwarding of INTx messages from the downstream device of the Switch port is not reflected in this bit. Must be hardwired to 0. | No                   | 0       |

| BIT   | FUNCTION                  | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------|-------|---|----------------------|---------|
| 20    | Capabilities List         | RO    | Set to 1b to enable support for the capability list (offset 34h is the pointer to the data structure).  | No                   | 1       |
| 21    | 66MHz Capable             | RsvdP | Not support   | No                   | 0       |
| 22    | Reserved                  | RsvdP | Not support.  | No                   | 0       |
| 23    | Fast Back-to-Back Capable | RsvdP | Not support.  | No                   | 0       |
| 24    | Master Data Parity Error  | RW1C  | Set to 1b (by a requester) whenever a Parity error is detected or forwarded on the primary side of the port in a Switch.<br><br>If the Parity Error Response Enable bit is cleared, this bit is never set.                | No                   | 0       |
| 26:25 | DEVSEL# timing            | RsvdP | Not support.  | No                   | 00b     |
| 27    | Signaled Target Abort     | RW1C  | This bit is Set when the Secondary Side for Type 1 Configuration Space header Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted Request as a Completer Abort error. | No                   | 0       |
| 28    | Received Target Abort     | RsvdP | Not support.  | No                   | 0       |
| 29    | Received Master Abort     | RsvdP | Not support.  | No                   | 0       |
| 30    | Signaled System Error     | RW1C  | Set to 1b when the Switch sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR Enable bit in the Command register is 1b.  | No                   | 0       |
| 31    | Detected Parity Error     | RW1C  | Set to 1b whenever the primary side of the port in a Switch receives a Poisoned TLP.  | No                   | 0       |

### 9.6.5 REVISION ID REGISTER – OFFSET 08h

| BIT | FUNCTION | TYPE | DESCRIPTION                          | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------|------|--------------------------------------|----------------------|---------|
| 7:0 | Revision | RO   | Indicates revision number of device. | No                   | 07h     |

### 9.6.6 CLASS CODE REGISTER – OFFSET 08h

| BIT   | FUNCTION              | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-----------------------|------|--|----------------------|---------|
| 15:8  | Programming Interface | RO   | Read as 00h.   | No                   | 00h     |
| 23:16 | Sub-Class Code        | RO   | Read as 80h.   | No                   | 80h     |
| 31:24 | Base Class Code       | RO   | Read as 08h to indicate device is other system peripheral. | No                   | 08h     |

### 9.6.7 CACHE LINE REGISTER – OFFSET 0Ch

| BIT | FUNCTION        | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|-----------------|------|---|----------------------|---------|
| 7:0 | Cache Line Size | RW   | The cache line size register is set by the system firmware and the operating system cache line size. This field is implemented by PCI Express devices as a RW field for legacy compatibility, but it has no impact on any PCI Express device functionality. | No                   | 00h     |

### 9.6.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

| BIT  | FUNCTION              | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------------|-------|--------------|----------------------|---------|
| 15:8 | Primary Latency Timer | RsvdP | Not support. | No                   | 00h     |

### 9.6.9 HEADER TYPE REGISTER – OFFSET 0Ch

| BIT   | FUNCTION    | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|-------------|------|--|----------------------|---------|
| 23:16 | Header Type | RO   | Read as 80h to indicate that the register layout conforms to Type 0 Configuration Header for the other device. | No                   | 80h     |

### 9.6.10 BAR 0 REGISTER – OFFSET 10h

| BIT   | FUNCTION               | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|------------------------|-------|--|----------------------|---------|
| 0     | Memory Space Indicator | RO    | When set '0', it indicates Memory Base address.                      | No                   | 0       |
| 2:1   | 64-bit Addressing      | RO    | 00b: 32-bit addressing<br>10b: 64-bit addressing<br>Others: Reserved | No                   | 10b     |
| 3     | Prefetchable           | RO    | 0b: Non-prefetchable<br>1b: Prefetchable                             | No                   | 0       |
| 11:4  | Reserved               | RsvdP | Not support.   | No                   | 0-0h    |
| 31:12 | Base Address 0 [31:12] | RW    | Use this Memory base address to map DMA engine registers.            | No                   | 0-0h    |

### 9.6.11 BAR 1 REGISTER – OFFSET 14h

| BIT  | FUNCTION               | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|------------------------|------|--|----------------------|------------|
| 31:0 | Reserved               | RO   | When the Base Address 0 register is not 64-bit addressing (offset 10h[2:1] is not 10b).  | No                   | 0000_0000h |
|      | Base Address 1 [63:32] | RW   | When the Base Address 0 register is 64-bit addressing. Base Address 1 is used to provide the upper 32 Address bits when offset 10h[2:1] is set to 10b. | No                   |            |

### 9.6.12 SUBSYSTEM VENDOR ID REGISTER – OFFSET 2Ch

| BIT  | FUNCTION | TYPE | DESCRIPTION                            | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|----------|------|--|----------------------|---------|
| 15:0 | SSVID    | RO   | It indicates the sub-system vendor id. | No                   | 12D8h   |

### 9.6.13 SUBSYSTEM ID REGISTER – OFFSET 2Ch

| BIT   | FUNCTION | TYPE | DESCRIPTION                            | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------|------|--|----------------------|---------|
| 31:16 | SSID     | RO   | It indicates the sub-system device id. | No                   | C016h   |

### 9.6.14 CAPABILITY POINTER REGISTER – OFFSET 34h

| BIT | FUNCTION           | TYPE | DESCRIPTION                              | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|--------------------|------|--|----------------------|---------|
| 7:0 | Capability Pointer | RO   | Point to first PCI capability structure. | No                   | 40h     |

### 9.6.15 INTERRUPT LINE REGISTER – OFFSET 3Ch

| BIT | FUNCTION       | TYPE | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|----------------|------|--|----------------------|---------|
| 7:0 | Interrupt Line | RW   | The interrupt line register communicates interrupt line routing information. | No                   | 00h     |

### 9.6.16 INTERRUPT PIN REGISTER – OFFSET 3Ch

| BIT  | FUNCTION      | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|---------------|------|---|----------------------|---------|
| 15:8 | Interrupt Pin | RO   | The Switch implements INTB virtual wire interrupt signal. | No                   | 02h     |

### 9.6.17 POWER MANAGEMENT CAPABILITIES REGISTER – OFFSET 40h

| BIT   | FUNCTION                       | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------|-------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID       | RO    | Read as 01h to indicate that this is power management capability register.   | No                   | 01h     |
| 15:8  | Next Item Pointer              | RO    | Point to next PCI capability structure.  | No                   | 48h     |
| 18:16 | Power Management Revision      | RO    | Read as 011b to indicate the device is compliant to Revision 1.2 of <i>PCI Power Management Interface Specifications</i> . | No                   | 011b    |
| 19    | PME# Clock                     | RsvdP | Not support.   | No                   | 0       |
| 20    | Reserved                       | RsvdP | Not support.   | No                   | 0       |
| 21    | Device Specific Initialization | RO    | Read as 0b to indicate Switch does not have device specific initialization requirements.                                   | No                   | 0       |
| 24:22 | AUX Current                    | RO    | Reset to 0.  | No                   | 000b    |
| 25    | D1 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D1 power management state.  | No                   | 0       |
| 26    | D2 Power State Support         | RO    | Read as 0b to indicate Switch does Not support the D2 power management state.  | No                   | 0       |
| 31:27 | PME# Support                   | RO    | Read as 19h to indicate Switch supports the forwarding of PME# message in D0, D3 and D4 states.                            | No                   | 19h     |

### 9.6.18 POWER MANAGEMENT DATA REGISTER – OFFSET 44h

| BIT   | FUNCTION      | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|-------|--|----------------------|---------|
| 1:0   | Power State   | RW    | Indicates the current power state of the Switch. Writing a value of D0 when the previous state was D3 cause a hot reset without asserting DWRST_L.<br><br>00b: D0 state<br>01b: D1 state<br>10b: D2 state<br>11b: D3 hot state | No                   | 00b     |
| 2     | Reserved      | RsvdP | Not support.   | No                   | 0       |
| 3     | No_Soft_Reset | RO    | When set, this bit indicates that device transitioning from D3hot to D0 does not perform an internal reset. When clear, an internal reset is performed when power state transits from D3hot to D0.                             | No                   | 1       |
| 7:4   | Reserved      | RsvdP | Not support.   | No                   | 0h      |
| 8     | PME# Enable   | RW    | When asserted, the Switch will generate the PME# message.  | No                   | 0       |
| 12:9  | Data Select   | RO    | Select data registers.   | No                   | 0h      |
| 14:13 | Data Scale    | RO    | Reset to 00b.  | No                   | 00b     |
| 15    | PME Status    | RW1C  | Read as 0b as the PME# message is not implemented.   | No                   | 0       |

### 9.6.19 PPB SUPPORT EXTENSIONS – OFFSET 44h

| BIT   | FUNCTION                         | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT  |
|-------|----------------------------------|-------|--|----------------------|----------|
| 21:16 | Reserved                         | RsvdP | Not support.   | No                   | 00_0000b |
| 22    | B2_B3 Support for D3HOT          | RO    | Does not apply to PCI Express. Must be hardwired to 0. | No                   | 0        |
| 23    | Bus Power / Clock Control Enable | RO    | Does not apply to PCI Express. Must be hardwired to 0. | No                   | 0        |

### 9.6.20 DATA REGISTER – OFFSET 44h

| BIT   | FUNCTION      | TYPE | DESCRIPTION    | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------|------|----------------|----------------------|---------|
| 31:24 | Data Register | RO   | Data Register. | No                   | 00h     |

### 9.6.21 MSI CAPABILITIES REGISTER – OFFSET 48h

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|----------------------------|-------|--|----------------------|---------|
| 7:0   | Enhanced Capabilities ID   | RO    | Read as 05h to indicate that this is message signal interrupt capability register.   | No                   | 05h     |
| 15:8  | Next Item Pointer          | RO    | Point to next PCI capability structure.  | No                   | 68h     |
| 16    | MSI Enable                 | RW    | 0b: The function is prohibited from using MSI to request service<br>1b: The function is permitted to use MSI to request service and is prohibited from using its INTx # pin  | No                   | 0       |
| 19:17 | Multiple Message Capable   | RO    | Request 8 multiple vectors to system. Each vector is corresponding to each virtual channel   | No                   | 011b    |
| 22:20 | Multiple Message Enable    | RW    | System software writes to this field indicating the numbers of vectors are allocated.<br>000b: one vector allocated. All 4 dma virtual channels share this MSI<br>001b: two vectors allocated.<br>DVC0~1 use MSI#0 while DVC4~5 use MSI#1<br>010b: the same as 001b<br>011b: four vectors allocated and each DVC uses its own MSI<br>DVC0 (MSI#0), DVC1 (MSI#1),<br>DVC4 (MSI#4), DVC5 (MSI#5) | No                   | 000b    |
| 23    | 64-bit address capable     | RO    | 0b: The function is not capable of generating a 64-bit message address<br>1b: The function is capable of generating a 64-bit message address   | No                   | 1       |
| 24    | Per-vector masking capable | RO    | 0b: the function support MSI per-vector masking.<br>1b: the function does Not support MSI per-vector masking.  | No                   | 1       |
| 31:25 | Reserved                   | RsvdP | Not support.   | No                   | 00h     |

### 9.6.22 MESSAGE ADDRESS REGISTER – OFFSET 4Ch

| BIT  | FUNCTION        | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|------|-----------------|-------|---|----------------------|---------|
| 1:0  | Reserved        | RsvdP | Not support.  | No                   | 00b     |
| 31:2 | Message Address | RW    | If the message enable bit is set, the contents of this register specify the DWORD aligned address for MSI memory write transaction. | No                   | 0-0h    |

### 9.6.23 MESSAGE UPPER ADDRESS REGISTER – OFFSET 50h

| BIT  | FUNCTION              | TYPE | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT    |
|------|-----------------------|------|---|----------------------|------------|
| 31:0 | Message Upper Address | RW   | This register is only effective if the device supports a 64-bit message address is set. | No                   | 0000_0000h |

### 9.6.24 MESSAGE DATA REGISTER – OFFSET 54h

| BIT   | FUNCTION     | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------|-------|--------------|----------------------|---------|
| 15:0  | Message Data | RW    | Reset to 0.  | No                   | 0000h   |
| 31:16 | Reserved     | RsvdP | Not support. | No                   | 0000h   |

### 9.6.25 MESSAGE MASK REGISTER – OFFSET 58h

| BIT  | FUNCTION                    | TYPE  | DESCRIPTION                                  | EEPROM/<br>I2C-SMBUS | DEFAULT   |

| 7    | Reserved                       | RsvdP | Not support.   | No                   | 0         |
| 31:8 | Reserved                       | RsvdP | Not support.   | No                   | 0000_000h |

### 9.6.27 PCI EXPRESS CAPABILITIES REGISTER – OFFSET 68h

| BIT   | FUNCTION                 | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------|-------|---|----------------------|---------|
| 7:0   | Enhanced Capabilities ID | RO    | Read as 10h to indicate that this is PCI express enhanced capability register.                              | No                   | 10h     |
| 15:8  | Next Item Pointer        | RO    | Point to next PCI capability structure.   | No                   | A4h     |
| 19:16 | Capability Version       | RO    | Read as 2h to indicate the device is compliant to Revision .2.0 of <i>PCI Express Base Specifications</i> . | No                   | 2h      |
| 23:20 | Device/Port Type         | RO    | Indicates the type of PCI Express logical device.   | No                   | 0h      |
| 24    | Slot Implemented         | RO    | Reset to 0b.  | No                   | 0       |
| 29:25 | Interrupt Message Number | RO    | Read as 0. No MSI messages are generated in the transparent mode.   | No                   | 00_000b |
| 31:30 | Reserved                 | RsvdP | Not support.  | No                   | 00b     |

### 9.6.28 DEVICE CAPABILITIES REGISTER – OFFSET 6Ch

| BIT | FUNCTION                     | TYPE  | DESCRIPTION   | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-----|------------------------------|-------|---|----------------------|---------|
| 2:0 | Max_Payload_Size Supported   | RO    | Indicates the maximum payload size that the device can support for TLPs. Each port of the Switch supports 512 bytes max payload size.                       | No                   | 010b    |
| 4:3 | Phantom Functions Supported  | RO    | Indicates the support for use of unclaimed function numbers as Phantom functions. Read as 00b, since no function number bits are used as phantom functions. | No                   | 00b     |
| 5   | Extended Tag Field Supported | RO    | Indicates the maximum supported size of Tag field as a Requester. Read as 0, since the function supports 5-bit tage field only.                             | No                   | 0       |
| 8:6 | Reserved                     | RsvdP | Not support.  | No                   | 000b    |

| BIT   | FUNCTION                        | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|---------------------------------|-------|--|----------------------|---------|
| 11:9  | Reserved                        | RsvdP | Not support.   | No                   | 000b    |
| 14:12 | Reserved                        | RsvdP | Not support.   | No                   | 000b    |
| 15    | Role_Based Error Reporting      | RO    | When set, indicates that the device implements the functionality originally defined in the Error Reporting ECN.  | No                   | 1       |
| 17:16 | Reserved                        | RsvdP | Not support.   | No                   | 00b     |
| 25:18 | Captured Slot Power Limit Value | RO    | In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00h. | No                   | 00h     |
| 27:26 | Captured Slot Power Limit Scale | RO    | Specifies the scale used for the Slot Power Limit Value.<br><br>This value is set by the Set_Slot_Power_Limit message or hardwired to 00b.   | No                   | 00b     |
| 31:28 | Reserved                        | RsvdP | Not support.   | No                   | 0h      |

### 9.6.29 DEVICE CONTROL REGISTER – OFFSET 70h

| BIT   | FUNCTION                             | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT |
|-------|--------------------------------------|-------|--|----------------------|---------|
| 0     | Correctable Error Reporting Enable   | RW    | 0b: Disable Correctable Error Reporting<br>1b: Enable Correctable Error Reporting  | No                   | 0       |
| 1     | Non-Fatal Error Reporting Enable     | RW    | 0b: Disable Non-Fatal Error Reporting<br>1b: Enable Non-Fatal Error Reporting  | No                   | 0       |
| 2     | Fatal Error Reporting Enable         | RW    | 0b: Disable Fatal Error Reporting<br>1b: Enable Fatal Error Reporting  | No                   | 0       |
| 3     | Unsupported Request Reporting Enable | RW    | 0b: Disable Unsupported Request Reporting<br>1b: Enable Unsupported Request Reporting  | No                   | 0       |
| 4     | Enable Relaxed Ordering              | RO    | When set, it permits the device to set the Relaxed Ordering bit in the attribute field of transaction.   | No                   | 0       |
| 7:5   | Max_Payload_Size                     | RW    | This field sets maximum TLP payload size for the device. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported in the Device Capabilities register. Any value exceeding the Max_Payload_Size Supported written to this register results into clamping to the Max_Payload_Size Supported value. | No                   | 000b    |
| 8     | Extended Tag Field Enable            | RW    | Returns '0' when read, since extended tag field is Not supported.  | No                   | 0       |
| 9     | Phantom Function Enable              | RW    | Returns '0' when read, since Phantom Function is Not supported.  | No                   | 0       |
| 10    | Auxiliary (AUX) Power PM Enable      | RO    | When set, indicates that a device is enabled to draw AUX power independent of PME AUX power.   | No                   | 0       |
| 11    | Enable No Snoop                      | RW    | When set, it permits to set the No Snoop bit in the attribute field of transaction.  | No                   | 0       |
| 14:12 | Max_Read_Request_Size                | RW    | This field sets the maximum Read Request size for the device as a Requester. The function must not generate Read Requests with a size exceeding the set value.   | No                   | 010b    |
| 15    | Reserved                             | RsvdP | Not support.   | No                   | 0       |

| 127:96 | 4 <sup>th</sup> DWORD | RO   | Hold the 4th DWORD of TLP Header. The Head byte is in big endian. | No                   | 0000_0000h |

## 9.7 DMA ENGINE INTERFACE REGISTERS

To enable DMA function, the packet switch defines a set of interface registers for software to control the DMA engine and monitor the status of DMA transfer. There are two DMA engines (DMA\_0 and DMA\_1) in this Switch to face either one common or two different CPU domains respectively, so it defines an independent interface for software to access its own registers in its own CPU domain. The interface registers contain per-channel DMA control and status registers, descriptor ownership registers, descriptor pointer registers and property registers (such as max payload size, max read request size and bus number of CDEP port etc.) for cross-domain DMA transfer.

The interface registers are mapped to multiple 256-byte register blocks in memory mode and each 256-byte register block represents one channel. The register blocks can be accessed by the DMA Memory Base Address, which is obtained by DMA Base Address Register 0 (Func1, CFG offset 10h or Func2, CFG offset 10h based upon different DMA mode selection, and please note that each DMA engine is viewed as a PCIe function by enumeration).

**Table 9-12 DMA Base Address in Memory Mode when DMA channels pertaining to the same host domain**

| DMA Engine                      | DMA Memory Base Address    |
|---------------------------------|----------------------------|
| Upstream Port CSR for Channel 0 | Upstream Port BAR0 + 0000h |
| Upstream Port CSR for Channel 1 | Upstream Port BAR0 + 0100h |
| N/A                             | Reserved                   |
| N/A                             | Reserved                   |
| Upstream Port CSR for Channel 4 | Upstream Port BAR0 + 0400h |
| Upstream Port CSR for Channel 5 | Upstream Port BAR0 + 0500h |
| N/A                             | Reserved                   |
| N/A                             | Reserved                   |

**Table 9-13 DMA Base Address in Memory Mode when DMA channels pertaining to different host domain**

| DMA Engine                      | DMA Memory Base Address    |
|---------------------------------|----------------------------|
| Upstream Port CSR for Channel 0 | Upstream Port BAR0 + 0000h |
| Upstream Port CSR for Channel 4 | Upstream Port BAR0 + 0400h |
| CDEP CSR for Channel 0          | CDEP BAR0 + 0000h          |
| CDEP CSR for Channel 4          | CDEP BAR0 + 0400h          |

Following is a summary of addressing map for interface registers. Please note that the max.length for read/write register only supports 4 bytes.

| 31 – 24                                  | 23 – 16   | 15 – 8                        | 7 – 0 | BYTE OFFSET |

### 9.7.1 DMA CONTROL AND STATUS REGISTER 0 – OFFSET 00h

| BIT   | FUNCTION             | TYPE  | DESCRIPTION   | DEFAULT |
|-------|----------------------|-------|---|---------|
| 0     | No Snooping Mode     | RW    | Configuration of No Snooping.<br>0b: Disable no snooping<br>1b: Enable no snooping  | 0       |
| 1     | Address Format       | RW    | Indicate the addressing system a DMA operation is riding on.<br>0b: 32-bit addressing system<br>1b: 64-bit addressing system  | 0       |
| 7:2   | Reserved             | RsvdP | Not support.  | 00_000b |
| 8     | EOT Valid            | RW    | When set, the EOT bit in descriptor is valid under the condition of DMA channels. EOT bit will be updated from 0 to 1 by the switch once the data transfer indicated in that descriptor is ended. | 0       |
| 16:9  | Reserved             | RsvP  | Not support.  | 00h     |
| 17    | UCE Interrupt Enable | RW    | When set, Interrupt is issued when detecting Uncorrectable Error  | 0       |
| 18    | Error Report Scheme  | RW    | When clear, DMA reports UCE event without writing DP TLP to destination address.<br>When set, DMA reports UCE event after writing DP TLP to destination address                                   | 0       |
| 27:19 | Reserved             | RsvP  | Not support.  | 0-0b    |
| 31:28 | Channel ID           | RO    | Indicate the channel ID is used by which channel of DMA.  | 0h      |

### 9.7.2 DESCRIPTOR OWNERSHIP REGISTER 0 – OFFSET 04h

| BIT  | FUNCTION               | TYPE | DESCRIPTION   | DEFAULT   |
|------|------------------------|------|---|-----------|
| 31:0 | Descriptor Ownership 0 | RW   | Indicate the ownership of descriptor 0. That means the owner can access the buffer pointed by the address field of descriptor 0.<br><br>1b: the DMA channel owns the descriptor 0<br>0b: the DMA driver owns the descriptor 0<br><br>After the buffer prepared by DMA driver, it will write “1” to the corresponding descriptor ownership bit. After the descriptor is done, the DMA channel will clear the corresponding bit to “0”. | 0000_000h |

### 9.7.3 DESCRIPTOR OWNERSHIP REGISTER1 – OFFSET 08h

| BIT  | FUNCTION               | TYPE | DESCRIPTION   | DEFAULT   |
|------|------------------------|------|---|-----------|
| 31:0 | Descriptor Ownership 1 | RW   | Indicate the ownership of descriptor. That means the owner can access the buffer pointed by the address field of descriptor 1.<br><br>1b: the DMA channel owns the descriptor 1<br>0b: the DMA driver owns the descriptor 1<br><br>After the buffer prepared by DMA driver, it will write “1” to the corresponding descriptor ownership bit. After the descriptor is done, the DMA channel will clear the corresponding bit to “0”. | 0000_000h |

### 9.7.4 CHANNELDESCRIPTOR RING BASE POINTER (LOW 32-bit)REGISTER – OFFSET 0Ch

| BIT  | FUNCTION                                  | TYPE  | DESCRIPTION  | DEFAULT    |
|------|---|-------|--|------------|
| 1:0  | Reserved                                  | RsvdP | Not support.   | 00b        |
| 31:2 | Descriptor Ring Base Pointer (Low 32-bit) | RW    | Lower 32-bit of Base Pointer referring to the 1 <sup>st</sup> entry of descriptor ring. It tells DMA channel where the descriptor is starting at. The base pointer is in 64-bit alignment. | 0000_0000h |

### 9.7.5 CHANNELDESCRIPTOR RING BASE POINTER (HIGH 32-bit) REGISTER – OFFSET 10h

| BIT  | FUNCTION                                   | TYPE | DESCRIPTION   | DEFAULT    |
|------|--|------|---|------------|
| 31:0 | Descriptor Ring Base Pointer (High 32-bit) | RW   | Upper 32-bit of Base Pointer referring to the 1st entry of descriptor ring if 64-bit addressing system is used. It tells DMA channel where the descriptor is starting at. | 0000_0000h |

### 9.7.6 CHANNEL DESCRIPTOR CURRENT POINTER REGISTER – OFFSET 14h

| BIT   | FUNCTION  | TYPE  | DESCRIPTION   | DEFAULT |
|-------|---|-------|---|---------|
| 11:0  | Descriptor Current Pointer (Offset from Base Pointer) | RO    | Indicating the current pointer (Offset from Base Pointer) referring to the descriptor that is under processing by DMA Engine in terms of index. A maximum of 4096 pointers are allowed. | 000h    |
| 31:12 | Reserved  | RsvdP | Not support.  | 00000h  |

### 9.7.7 CHANNEL TRANSFER COUNT STATUS OF CURRENT DESCRIPTOR POINTER REGISTER – OFFSET 18h

| BIT   | FUNCTION              | TYPE  | DESCRIPTION   | DEFAULT  |
|-------|-----------------------|-------|---|----------|
| 23:0  | Transfer Count Status | RO    | Indicating how many byte counts have been not transferred for the current descriptor pointer. | 00_0000h |
| 31:24 | Reserved              | RsvdP | Not support.  | 00h      |

### 9.7.8 CHANNEL GAP TIME CONTROL REGISTER – OFFSET 1Ch

| BIT   | FUNCTION                    | TYPE | DESCRIPTION  | DEFAULT |
|-------|-----------------------------|------|--|---------|
| 15:0  | Write Data Gap Time Control | RW   | Control the gap time between DMA writes. It is represented by 16 bits in a unit of 4ns | 0000h   |
| 31:16 | Fetch Data Gap Time Control | RW   | Control the gap time between DMA reads. It is represented by 16 bits in a unit of 4ns  | 0000h   |

### 9.7.9 DMA CONTROL AND STATUS REGISTER 1 – OFFSET 20h

| BIT | FUNCTION          | TYPE | DESCRIPTION   | DEFAULT |
|-----|-------------------|------|---|---------|
| 0   | DMA Start         | RWIO | Start DMA operation.<br>1b: the DMA operation starts to fetch and process the descriptors except the DMA stop or abort status is on.<br>0b: the current pointer will be moved to the descriptor ring base pointer or next descriptor pointer and stop the DMA operation.<br><br>This bit can only be written with “1” and will not take effect if written with “0”. Only when DMA operation is stopped or aborted, this bit will be automatically cleaned to “0”.   | 0       |
| 1   | DMA Pause Control | RW   | Pause DMA Operation. When set, the DMA operation is paused to the next active descriptor after completing the processing on current descriptor. It means that no more descriptors are processed and prefetched until the “Paused” condition is lifted.<br><br>For Host-to-Host DMA operation, the remote-site has to pause its DMA operation at first and ensure the pause done status has been asserted. After that, the local-site is just allowed to pause DMA operation.<br><br>If pause interrupt is enabled and pause control is also enabled, the <code>interruptflagis</code> asserted until cleared by software. | 0       |

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION  | DEFAULT |
|-------|----------------------------|-------|--|---------|
| 2     | DMA Abort Control          | RW    | <p>Abort DMA Operation. When set, the DMA operation drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The pointer will move to the next active descriptor. No more descriptors are processed and prefetched until the “Aborted” condition is lifted.</p> <p>All receiving data will be discarded if DMA abort asserted. Removing abort condition can only use DMA start control</p> <p>For Host-to-Host DMA operation, the remote-site has to abort its DMA operation at first and ensure the abort done status has been asserted. After that, the local-site is just allowed to abort DMA operation.</p> <p>If abort interrupt is enabled and abort control is also enabled, the interruptflagis asserted until cleared by software.</p>                           | 0       |
| 3     | DMA Pause Interrupt Enable | RW    | When set, Interrupt is issued when DMA operation is paused.  | 0       |
| 4     | Reserved                   | RsvdP | Not support.   | 0       |
| 5     | DMA Stop Interrupt Enable  | RW    | When set, Interrupt is issued when DMA operation is stopped.   | 0       |
| 6     | DMA Abort Interrupt Enable | RW    | When set, Interrupt is issued when DMA operation is aborted.   | 0       |
| 7     | DMA Stop Control           | RWIC  | <p>Stop DMA Operation. When set, the DMA operation drops the current active descriptor by flushing out all outstanding read commands and discarding all received completion data. The channel interface registers are all cleaned to default state except Interrupt flag bit if DMA stop enable is set earlier. No more descriptors are processed and prefetched.</p> <p>All receiving data will be discarded if DMA stop asserted. Removing stop condition can only use DMA start control</p> <p>For Host-to-Host DMA operation, the remote-site has to stop its DMA operation at first and ensure the stop done status has been asserted. After that, the local-site is just allowed to stop DMA operation.</p> <p>If stop interrupt is enabled and stop control is also enabled, the interrupt flag is asserted until cleaned by software</p> | 0       |
| 8     | Ownership Flush            | RW    | Clear ownership register when DMA operation is stopped.  | 0       |
| 15:9  | Reserved                   | RsvdP | Not support.   | 00h     |
| 16    | DMA Pause Done Status      | RO    | Indicates the DMA operation is in “Paused” condition. Removing pause done status can use DMA Pause control.  | 0       |
| 17    | DMA Abort Done Status      | RO    | Indicates the DMA operation is in “Aborted” condition. Removing abort done status can only use DMA start control.  | 0       |
| 18    | DMA Stop Done Status       | RO    | Indicates the DMA operation is in “Stopped” condition. Removing Stop done status can only use DMA start control.   | 1       |
| 30:19 | Reserved                   | RsvdP | Not support.   | 000h    |
| 31    | Interrupt Flag             | RWIC  | Indicates the interrupt asserted.  | 0       |

### 9.7.10 CHANNEL DESCRIPTOR RING SIZE FORPREFETCH – OFFSET 24h

| BIT   | FUNCTION                   | TYPE  | DESCRIPTION   | DEFAULT |
|-------|----------------------------|-------|---|---------|
| 12:0  | Descriptor size            | RW    | The number of descriptors available for H/W to prefetch is ranged from 1 to 4096. | 0040h   |
| 15:13 | Reserved                   | RsvdP | Not support.  | 000b    |
| 28:16 | Pre-fetch Descriptor Index | RO    | Index value of next descriptor for Prefetch                                       | 0000h   |
| 31:29 | Reserved                   | RsvdP | Not support.  | 000b    |

### 9.7.14 CHANNEL UNCORRECTABLE EEEOR STATUS– OFFSET 44h

| BIT   | FUNCTION                           | TYPE  | DESCRIPTION  | EEPROM/<br>I2C-SMBUS | DEFAULT   |
|-------|------------------------------------|-------|--|----------------------|-----------|
| 0     | Training Error Status              | RW1C  | When set, indicates that the Training Error event has occurred.                      | Yes                  | 0         |
| 3:1   | Reserved                           | RsvdP | Not support.   | No                   | 000b      |
| 4     | Data Link Protocol Error Status    | RW1C  | When set, indicates that the Data Link Protocol Error event has occurred.            | Yes                  | 0         |
| 5     | Surprise Down Error Status         | RW1C  | When set, indicates that the Surprise Down Error event has occurred.                 | Yes                  | 0         |
| 11:6  | Reserved                           | RsvdP | Not support.   | No                   | 0-0b      |
| 12    | Poisoned TLP Status                | RW1C  | When set, indicates that a Poisoned TLP has been received or generated.              | Yes                  | 0         |
| 13    | Flow Control Protocol Error Status | RW1C  | When set, indicates that the Flow Control Protocol Error event has occurred.         | Yes                  | 0         |
| 14    | Completion Timeout Status          | RW1C  | When set, indicates that the Completion Timeout event has occurred.                  | Yes                  | 0         |
| 15    | Completer Abort Status             | RW1C  | When set, indicates that the Completer Abort event has occurred.                     | Yes                  | 0         |
| 16    | Unexpected Completion Status       | RW1C  | When set, indicates that the Unexpected Completion event has occurred.               | Yes                  | 0         |
| 17    | Receiver Overflow Status           | RW1C  | When set, indicates that the Receiver Overflow event has occurred.                   | Yes                  | 0         |
| 18    | Malformed TLP Status               | RW1C  | When set, indicates that a Malformed TLP has been received.                          | Yes                  | 0         |
| 19    | ECRC Error Status                  | RW1C  | When set, indicates that an ECRC Error has been detected.                            | Yes                  | 0         |
| 20    | Unsupported Request Error Status   | RW1C  | When set, indicates that an Unsupported Request event has occurred.                  | Yes                  | 0         |
| 21    | ACS Violation Status               | RW1C  | When set, indicates that an ACS Violation event has occurred.                        | Yes                  | 0         |
| 22    | Internal Error Status              | RW1C  | When set, indicates that an Internal Error has occurred.                             | Yes                  | 0         |
| 23    | MC Blocked TLP Status              | RW1C  | When set, indicates that an MC Blocked TLP event has occurred.                       | Yes                  | 0         |
| 24    | AtomicOp Egress Blocked Status     | RW1C  | When set, indicates that an AtomicOp Egress Blocked event has occurred.              | Yes                  | 0         |
| 25    | Descriptor Error                   | RW1C  | When set, indicates an Uncorrectable Error happening in descriptor                   | Yes                  | 0         |
| 26    | Data Buffer Error                  | RW1C  | When set, indicates an Uncorrectable Error happening in moving data into DMA buffer. | Yes                  | 0         |
| 31:27 | Reserved                           | RsvdP | Not support.   | No                   | 0000_000b |

### 9.7.15 DMA READ THRESHOLD CONTROL – OFFSET 5Ch

| BIT  | FUNCTION                 | TYPE  | DESCRIPTION   | DEFAULT |
|------|--------------------------|-------|---|---------|
| 4:0  | Desc_Current_Arbiter_Sts | RO    | It will indicate descriptor current arbiter status. | 0_0001b |
| 5    | Desc_Arbiter_Reset       | RW    | When set, it will reset descriptor arbiter.         | 0       |
| 7:6  | Reserved                 | RsvdP | Not support.  | 00b     |
| 12:8 | DMA_Current_Arbiter_Sts  | RO    | It will indicate DMA current arbiter status.        | 0_0001b |

| BIT   | FUNCTION                  | TYPE  | DESCRIPTION  | DEFAULT |
|-------|---------------------------|-------|--|---------|
| 13    | DMA_Arbitrator_Reset      | RW    | When set, it will reset DMA arbiter.   | 0       |
| 15:14 | Reserved                  | RsvdP | Not support.   | 00b     |
| 24:16 | Threshold Value           | RW    | When threshold control disable is off, the next DMA read won't be issued until the threshold value is met. The default value is equivalent to 512 bytes. | 80h     |
| 25    | Threshold Control Disable | RW    | When set, DMA read is issued without waiting threshold limit being reached. The default is to disable threshold control.                                 | 1b      |
| 31:26 | Reserved                  | RsvdP | Not support.   | 0000_0b |

### 9.7.16 DMA HARDWARE CONTROL – OFFSET 88h (Global)

| BIT   | FUNCTION                            | TYPE  | DESCRIPTION  | DEFAULT |
|-------|-------------------------------------|-------|--|---------|
| 9:0   | DNOC Arbit Delay Time               | RW    | Used to set DNOC Arbit delay time.   | 0_00h   |
| 14:10 | Reserved                            | RsvdP | Not support  | 0       |
| 15    | DNOC Arbit Delay Time Enable        | RW    | When set, it will enable dnoc arbit delay time function for DMA packets The time unit is in 2ns.   | 0       |
| 22:16 | Back-to-Back Packet gap time        | RW    | For back-to-back DMA packets, a programmable gap time between continuous packets can be inserted. The time unit is in 2ns.   | 00h     |
| 23    | Back-to-Back Packet gap Time Enable | RW    | When set, it will enable back-to-back packet gap time.   | 0       |
| 24    | ECRC Check Enable override          | RW    | When clear, it can override ECRC check enable bit defined in AER control register from 1 to 0 for DMA packet only  | 1       |
| 25    | Arbitration option                  | RW    | This option bit controls the request/grant protocol between central arbiter and DMA engine. By default, the DMA request is not asserted until the last grant released. | 1       |
| 26    | MSI regeneration enable             | RW    | The MSI event will be regenerated once not getting service after a time-out period. When disabled, the MSI will be issued only one time.                               | 1       |
| 27    | Internal CAM hit Error Enable       | RW    | When set, it will enable CAM hit error function.   | 1       |
| 31:28 | Reserved                            | RsvdP | Not support  | 0000b   |

### 9.7.17 DMA HARDWARE STATUS – OFFSET 8Ch (Global)

| BIT  | FUNCTION               | TYPE  | DESCRIPTION   | DEFAULT |
|------|------------------------|-------|---|---------|
| 0    | ECRC Check Enable      | RO    | It is a mirror-bit of ECRC Check Enable status in AER control register      | 0       |
| 1    | ECRC Generation Enable | RO    | It is a mirror-bit of ECRC Generation Enable status in AER control register | 0       |
| 31:2 | Reserved               | RsvdP | Not support   | 0-0b    |

## 10 POWER SEQUENCE

As long as PERST# is asserted, all PCI Express functions are held in reset. The main supplies ramp up to their specified levels (0.95V/1.8V). Sometime during this stabilization time, the REFCLK starts and stabilizes. After elapsing some time (i.e. 100 us) for the power and clock to become stable, PERST# is deasserted high and the PCI Express functions can start up.

Figure 10-1 Initial Power-Up Sequence

## 11 IEEE 1149.1 COMPATIBLE JTAG CONTROLLER

An IEEE 1149.1 compatible Test Access Port (TAP) controller and associated TAP pins are provided to support boundary scan in PI7C9X3G816GP for board-level continuity test and diagnostics. The TAP pins assigned are TCK, TDI, TDO, TMS and TRST\_L. All digital input, output, input/output pins except TAP pins and SERDES pins are tested.

### 11.1 INSTRUCTION REGISTER

The IEEE 1149.1 Test Logic consists of a TAP controller, an instruction register, and a group of test data registers including Bypass and Boundary Scan registers. The TAP controller is a synchronous 16-state machine driven by the Test Clock (TCK) and the Test Mode Select (TMS) pins. An independent power on reset circuit is provided to ensure the machine is in TEST\_LOGIC\_RESET state at power-up.

PI7C9X3G816GP implements a 5-bit Instruction register to control the operation of the JTAG logic. The defined instruction codes are shown in the following table. Those bit combinations that are not listed are equivalent to the BYPASS (1111) instruction.

**Table 11-1 Instruction Register Codes**

| Instruction  | Operation Code (binary) | Register Selected | Operation   |
|--------------|-------------------------|-------------------|---|
| EXTEST       | 0000                    | Boundary Scan     | Drives / receives off-chip test data  |
| SAMPLE       | 0010                    | Boundary Scan     | Samples inputs  |
| EXTEST_PULSE | 0100                    | Boundary Scan     | Drives/receives off-chip test data for TX/RX pins   |
| EXTEST_TRAIN | 0101                    | Boundary Scan     | Drives/receives off-chip test data for TX/RX pins   |
| SCAN_TEST    | 1010                    | Internal          | Private instruction   |
| IDCODE       | 0001                    | Device ID         | Accesses the Device ID register, to read manufacturer ID, part number, and version number |
| RX_LEVEL     | 1011                    | Internal          | Private instruction   |
| NOC_BIST     | 0111                    | Internal          | Private instruction   |
| MBIST        | 1101                    | Internal          | Private instruction   |
| BYPASS       | 1111                    | Bypass            | Selected Bypass Register  |

### 11.2 BYPASS REGISTER

The required bypass register (one-bit shift register) provides the shortest path between TDI and TDO when a bypass instruction is in effect. This allows rapid movement of test data to and from other components on the board. This path can be selected when no test operation is being performed on the PI7C9X3G816GP.

### 11.3 DEVICE ID REGISTER

This register identifies Diodes as the manufacturer of the device and details the part number and revision number for the device.

**Table 11-2 JTAG Device ID Register**

| Bit   | Type | Value            | Description                                |
|-------|------|------------------|--|
| 31-28 | RO   | 0001             | Version number                             |
| 27-12 | RO   | 0001011000010110 | Last 4 digits (hex) of the die part number |
| 11-1  | RO   | 01000111111      | Diodes identifier assigned by JEDEC        |
| 0     | RO   | 1                | Fixed bit equal to 1'b1                    |

## 11.4 BOUNDARY SCAN REGISTER

The boundary scan register has a set of serial shift-register cells. A chain of boundary scan cells is formed by connected the internal signal of the PI7C9X3G816GP package pins. The VDD, VSS, and JTAG pins are not in the boundary scan chain. The input to the shift register is TDI and the output from the shift register is TDO. There are 4 different types of boundary scan cells, based on the function of each signal pin.

The boundary scan register cells are dedicated logic and do not have any system function. Data may be loaded into the boundary scan register master cells from the device input pins and output pin-drivers in parallel by the mandatory SAMPLE and EXTEST instructions. Parallel loading takes place on the rising edge of TCK.

## 11.5 JTAG BOUNDARY SCAN REGISTER ORDER

**Table 11-3 JTAG Boundary Scan Register Definition**

| Boundary Scan Register Number | Pin Name | Ball Location | Type         | Tri-state Control Cell |
|-------------------------------|----------|---------------|--------------|------------------------|
| 0                             |          |               | internal     |                        |
| 1                             |          |               | internal     |                        |
| 2                             | SDA_I2C  | J18           | bidir        | 3                      |
| 3                             |          |               | control      |                        |
| 4                             | SCL_I2C  | K18           | bidir        | 5                      |
| 5                             |          |               | control      |                        |
| 6                             |          |               | internal     |                        |
| 7                             |          |               | internal     |                        |
| 8                             | PERST_L  | F18           | input        |                        |
| 9                             |          |               | internal     |                        |
| 10                            |          |               | internal     |                        |
| 11                            | PDC_L[7] | N9            | bidir        | 12                     |
| 12                            |          |               | control      |                        |

## 12 ELECTRICAL AND TIMING SPECIFICATIONS

### 12.1 ABSOLUTE MAXIMUM RATINGS

**Table 12-1 Absolute Maximum Ratings**

(Above which the useful life may be impaired. For user guidelines, not tested.)

| Item  | Absolute Max. Rating |
|---|----------------------|
| Storage Temperature   | -65°C to 150°C       |
| Junction Temperature, T <sub>j</sub>  | 125°C                |
| Digital core and analog supply voltage to ground potential (VDDC and AVDD)      | VDDC +10%            |
| Digital I/O and analog high supply voltage to ground potential (VDDR and AVDDH) | VDDR + 10%           |
| DC input voltage for Digital I/O signals  | 2.75V                |
| ESD Rating  |                      |
| Human Body Model (JEDEC Class 2)  | HBM 2KV              |
| Charge Device Model (JEDEC Class 3)   | CDM 500V             |

**Note:**

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

### 12.2 DC ELECTRICAL CHARACTERISTICS

**Table 12-2 DC Electrical Characteristics**

| Symbol                            | Description                           | Min. | Typ. | Max. | Unit  |
|-----------------------------------|---------------------------------------|------|------|------|-------|
| VDDC <sup>2</sup>                 | Digital Core Power                    | 0.90 | 0.95 | 0.99 | V     |
| C_VDDR <sup>2</sup>               | Referenc Clock Power                  | 0.90 | 0.95 | 0.99 |       |
| VDDR <sup>3</sup>                 | Digital I/O Power                     | 1.71 | 1.8  | 1.89 |       |
| C_VDDR <sup>3</sup>               | Reference Clock Power                 | 1.71 | 1.8  | 1.89 |       |
| VP <sup>2</sup>                   | PCI Express Analog Power              | 0.90 | 0.95 | 0.99 |       |
| VPH <sup>3</sup>                  | PCI Express Analog High Voltage Power | 1.71 | 1.8  | 1.89 |       |
| V <sub>IH</sub>                   | Input High Voltage                    | 1.17 |      | 1.98 |       |
| V <sub>IL</sub>                   | Input Low Voltage                     | -0.3 |      | 0.63 |       |
| V <sub>OH</sub>                   | Output High Voltage                   | 1.35 |      |      |       |
| V <sub>OL</sub>                   | Output Low Voltage                    |      |      | 0.45 |       |
| R <sub>PU</sub>                   | Pull-up Resistor                      | 54K  | 80K  | 120K | Ω     |
| R <sub>PD</sub>                   | Pull-down Resistor                    | 55K  | 95K  | 176K |       |
| RST# <sub>Slew</sub> <sup>1</sup> | PERST_L Slew Rate                     | 50   |      |      | mV/ns |

**Note:**

- The min. value for PERST\_L Slew Rate is 50 mV/ns, which translates to the requirement that the time for PERST\_L from 0V to 2.5V should be less than 50 ns.
- Peak to peak AC noise < 5% of DC level.
- Peak to peak AC noise < 3% of DC level.

### 12.3 PCIE REFERENCE CLOCK REQUIREMENTS

Table 12-1 specifies the voltage/timing requirements and operating characteristics for PCIe PHY (REFCLKP/N[1:0] and REFCLKP/N[1:0]).

**Table 12-3 PCIe Reference Clock Requirement**

| Application         | Reference Clock Jitter and Swing Requirements                      |
|---------------------|--|
| PCIe 1.1 – 2.5 GT/s | Refer to the PCI Express 3.0 Card Electromechanical specification. |
| PCIe 2.1 – 5.0 GT/s | Refer to the PCI Express 3.1 base specification.                   |
| PCIe 3.1 – 8.0 GT/s | Refer to the PCI Express 3.1 base specification.                   |

## 12.4 INTEGRATED CLOCK BUFFER SPECIFICATIONS

The built-in Integrated Reference Clock Buffer of the PI7C9X3G816GP supports eight reference clock outputs. Table 12-4 and Table 12-5 specify the voltage/timing requirements and operating characteristics for internal clock buffer input (REFCLKIP/N and REFCLKIP/N) and outputs (REFCLKOP/N[7:0] and REFCLKOP/N[7:0]).

**Table 12-4 Integrated Clock Buffer Input Electrical Characteristics**

| Symbol                          | Description   | Min                   | Typ  | Max  | Unit              |
|---------------------------------|---|-----------------------|------|------|-------------------|
| V <sub>IHDIF</sub>              | Input High Voltage-DIF_IN (Single-ended)                                | 600                   | 800  | 1150 | mV                |
| V <sub>ILDIF</sub>              | Input Low Voltage-DIF_IN (Single-ended)                                 | V <sub>SS</sub> - 300 | 0    | 300  | mV                |
| V <sub>COM</sub>                | Input Common Mode Voltage-DIF_IN  | 300                   |      | 725  | mV                |
| V <sub>SWING</sub>              | Input Amplitude Peak-to-Peak (V <sub>IHDIF</sub> - V <sub>ILDIF</sub> ) | 300                   |      | 1450 | mV                |
| I <sub>IN</sub>                 | Input Leakage Current   | -5                    | 0.01 | 5    | uA                |
| D <sub>TIN</sub>                | Input Duty Cycle  | 45                    |      | 55   | %                 |
| J <sub>DIFIN</sub>              | Input Jitter – Cycle to Cycle   | 0                     |      | 150  | ps                |
| F <sub>TIN</sub>                | Input Frequency   |                       | 100  |      | MHz               |
| V <sub>IL(ASIC)</sub>           | Low-level input voltage   | 0                     |      |      | V                 |
| V <sub>IH(ASIC)</sub>           | High-level input voltage  |                       |      | 1    | V                 |
| T <sub>R</sub> , T <sub>F</sub> | Rise/Fall time of input clock   |                       |      | 0.1  | RCUI <sup>1</sup> |

Note<sup>1</sup>: RCUI refers to the reference clock period.

**Table 12-5 Integrated Clock Buffer Output Electrical Characteristics**

| Symbol                 | Description  | Min  | Typ  | Max  | Unit     |    |
|------------------------|--|--|------|------|----------|----|
| T <sub>R</sub>         | Output Rise Time (20% to 80%)  | 100  | 200  | 500  | ps       |    |
| T <sub>F</sub>         | Output Fall Time (80% to 20%)  | 100  | 200  | 500  | ps       |    |
| V <sub>HIGH</sub>      | Voltage High   | Statistical measurement on single-ended signal using oscilloscope math function (Scope averaging on) | 660  | 774  | 850      | mV |
| V <sub>LOW</sub>       | Voltage Low  |  | -150 | 18   | 150      | mV |
| V <sub>MAX</sub>       | Max Voltage  | Measurement on single ended signal using absolute value (Scope averaging off)                        |      | 821  | 1150     | mV |
| V <sub>MIN</sub>       | Min Voltage  |  | -300 | -15  |          | mV |
| V <sub>SWING</sub>     | Voltage Swing (Scope averaging off)  | 300  | 1536 |      | mV       |    |
| V <sub>CROSS_ABS</sub> | Absolute crossing voltage (Scope averaging off)                              | 250  | 414  | 550  | mV       |    |
| ΔV <sub>CROSS</sub>    | Variance crossing voltage (Scope averaging off)                              |  | 13   | 140  | mV       |    |
| T <sub>PCD</sub>       | Duty Cycle Distortion (measured differentially)                              | -3   | 0    | 3    | %        |    |
| T <sub>PD</sub>        | Skew, Input to Output  | 1000   | 3600 | 4500 | ps       |    |
| T <sub>JCC</sub>       | Additive Jitter, Cycle to Cycle  |  | 0.1  | 25   | ps (p-p) |    |
| T <sub>JPHG1</sub>     | Additive Phase Jitter for PCIe GEN1  |  | 0.6  | 5    | ps (rms) |    |
| T <sub>JPHG2</sub>     | Additive Phase Jitter for PCIe GEN2 Low Band 10 kHz < f < 1.5 MHz            |  | 0.1  | 0.3  | ps (rms) |    |
| T <sub>JPHG2</sub>     | Additive Phase Jitter for PCIe GEN2 High Band 1.5 MHz < f < Nyquist (50 MHz) |  | 0.05 | 0.1  | ps (rms) |    |
| T <sub>JPHG3</sub>     | Additive Phase Jitter for PCIe GEN3 (PLL BW of 2 ~ 4 MHz, CDR = 10 MHz)      |  | 0.05 | 0.1  | ps (rms) |    |

## 12.5 COMMON TRANSMITTER PARAMETERS

The following table defines the parameters for transmitters that are common among all three data rates. Parameters are defined separately for 2.5 GT/s, 5.0 GT/s and 8.0 GT/s implementations.

**Table 12-6 Transmitter Specifications**

| Symbol                    | Parameter              | 2.5 GT/s                     | 5.0 GT/s                     | 8.0 GT/s                         | Units | Comments  |
|---------------------------|------------------------|------------------------------|------------------------------|----------------------------------|-------|---|
| UI                        | Unit Interval          | 399.88 (min)<br>400.12 (max) | 199.94 (min)<br>200.06 (max) | 124.9625 (min)<br>125.0375 (max) | ps    | The specified UI is equivalent to a tolerance of ±300 ppm for each Refclk source. Period does not account for SSC induced variations. See Note 1. |
| BW <sub>TX-PLL</sub>      | Tx PLL BW for 2.5 GT/s | 22 (max)<br>1.5 (min)        | Not specified                | Not specified                    | MHz   | See Note 6.   |
| BW <sub>TX-PKG-PLL1</sub> | Tx PLL                 | Not specified                | 16 (max)                     | 4 (max)                          | MHz   | Second order PLL jitter transfer  |

| Symbol                            | Parameter  | 2.5 GT/s                   | 5.0 GT/s   | 8.0 GT/s  | Units     | Comments  |
|-----------------------------------|--|----------------------------|--|---|-----------|---|
|                                   | bandwidth corresponding to $PKG_{TX-PLL1}$                               |                            | 8 (min)  | 2 (min)   |           | bounding function. See Note 6.  |
| $BW_{TX-PKG-PLL2}$                | Tx PLL bandwidth corresponding to $PKG_{TX-PLL2}$                        | Not specified              | 16 (max)<br>5 (min)  | 5 (max)<br>2 (min)  | MHz       | Second order PLL jitter transfer bounding function. See Note 6.   |
| $PKG_{TX-PLL1}$                   | Tx PLL peaking   | Not specified              | 3.0 (max)  | 2.0 (Max)   | dB        | PLL BW = 8 MHz (min) @ 5.0 GT/s or BW = 4 MHz (max) @ 8.0 GT/s. See Note 6 and 8.   |
| $PKG_{TX-PLL2}$                   | Tx PLL peaking   | Not specified              | 1.0 (max)  | 1.0 (Max)   | dB        | PLL BW = 5 MHz (min) @ 5.0 GT/s or BW = 5 MHz (max) @ 8.0 GT/s. See Note 8.   |
| $V_{TX-DIFF-PP}$                  | Differential p-p Tx voltage swing  | 0.8 (min)<br>1.2 (max)     | 0.8 (min)<br>1.2 (max)                                       | See Table 12-7  | VPP       | As measured with compliance test load. Defined as $2* V_{TXD+}-V_{TXD-} $ .   |
| $V_{TX-DIFF-PP-LOW}$              | Low power differential p-p Tx voltage swing                              | 0.4 (min)<br>1.2 (max)     | 0.4 (min)<br>1.2 (max)                                       | See Table 12-7  | VPP       | As measured with compliance test load. Defined as $2* V_{TXD+}-V_{TXD-} $ . See Note 9.   |
| $V_{TX-DE-RATIO-3.5dB}$           | Tx de-emphasis level ratio   | 3.0 (min)<br>4.0 (max)     | 3.0 (min)<br>4.0 (max)                                       | See Table 12-7  | dB        | See PCI Express Base Specification Revision 3.1, Section 4.3.3.3 and Note 11.   |
| $\sqrt{V_{TX-DE-RATIO-6dB}}$      | Tx de-emphasis level   | N/A                        | 5.5 (min)<br>6.5 (max)                                       | See Table 12-7  | dB        | See PCI Express Base Specification Revision 3.1, Section 4.3.3.3 and Note 11.   |
| $T_{MIN-PULSE}$                   | Instantaneous lone pulse width   | Not specified              | 0.9 (min)  | See Table 12-7  | UI        | Measured relative to rising/falling pulse. See Note 2, 10 and PCI Express Base Specification Revision 3.1, Figure 4-38.   |
| $T_{TX-EYE}$                      | Transmitter Eye including all jitter sources                             | 0.75 (min)                 | 0.75 (min)   | See Table 12-7  | UI        | Does not include SSC or Refclk jitter. Includes Rj at $10^{-12}$ . Note that 2.5 GT/s and 5.0 GT/s use different jitter determination methods.                        |
| $T_{TX-EYE-MEDIAN-to-MAX-JITTER}$ | Maximum time between the jitter median and max deviation from the median | 0.125 (max)                | Not specified  | Not specified   | UI        | Measured differentially at zero crossing points after applying the 2.5 GT/s clock recovery function. See Note 2.  |
| $T_{TX-HF-DJ-DD}$                 | Tx deterministic jitter > 1.5 MHz  | Not specified              | 0.15 (max)   | See Table 12-7  | UI        | Deterministic jitter only. See Notes 2 and 10.  |
| $T_{TX-LF-RMS}$                   | Tx RMS jitter < 1.5 MHz  | Not specified              | 3.0  | See Table 12-7  | Ps<br>RMS | Total energy measured over a 10 kHz - 1.5 MHz range.  |
| $T_{RF-MISMATCH}$                 | Tx rise/fall mismatch  | Not specified              | 0.1 (max)  | Not specified   | UI        | Measured from 20% to 80% differentially. See Note 2.  |
| $RL_{TX-DIFF}$                    | Tx package plus Si differential return loss                              | 10 (min)                   | 10 (min) for 0.05 - 1.25 GHz<br>8 (min) for > 1.25 - 2.5 GHz | 10 (min) for 0.05 - 1.25 GHz<br>8 (min) for > 1.25 - 2.5 GHz<br>4 (min) for > 2.5 - 4 GHz | dB        | For details refer to PCI Express Base Specification Revision 3.1, Figure 4-56.  |
| $RL_{TX-CM}$                      | Tx package plus Si common mode return loss                               | 6 (min) for 0.05 - 2.5 GHz | 6 (min) for 0.05 - 2.5 GHz                                   | 6 (min) for 0.05 - 2.5GHz<br>3 (min) for 2.5 GHz  | dB        | For details refer to PCI Express Base Specification Revision 3.1, Figure 4-57.  |
| $Z_{TX-DIFF-DC}$                  | DC differential Tx impedance   | 80 (min)<br>120 (max)      | 120 (max)  | 120 (max)   | $\Omega$  | Low impedance defined during signaling. Parameter is captured for 5.0 GHz by $RL_{TX-DIFF}$ . The (min) value is bounded by $RL_{TX-DIFF}$ for 5.0 GT/s and 8.0 GT/s. |
| $V_{TX-CM-AC-PP}$                 | Tx AC peak-peak common mode voltage (5.0 GT/s)                           | Not specified              | 150 (max)  | 150 (max)   | mVPP      | At 8.0 GT/s, no more than 50mVPP in 0.03-500 MHz range. At 5.0GT/s no more than 100mVPP in 0.03-500 MHz range. See Notes 5 and 12.                                    |
| $V_{TX-CM-AC-P}$                  | Tx AC peak common mode voltage (2.5 GT/s)                                | 20                         | Not specified  | Not specified   | mV        | See Note 5.   |
| $I_{TX-SHORT}$                    | Transmitter short-circuit current  | 90 (max)                   | 90 (max)   | 90 (max)  | mA        | The total single-ended current a transmitter can supply when shorted  |

| Symbol                           | Parameter  | 2.5 GT/s              | 5.0 GT/s              | 8.0 GT/s               | Units | Comments  |
|----------------------------------|--|-----------------------|-----------------------|------------------------|-------|---|
|                                  | limit  |                       |                       |                        |       | to ground. See Note 13.   |
| $V_{TX-DC-CM}$                   | Transmitter DC common-mode voltage   | 0 (min)<br>3.6 (max)  | 0 (min)<br>3.6 (max)  | 0 (min)<br>3.6 (max)   | V     | The allowed DC common-mode voltage at a transmitter pin under any conditions. See Note 13.  |
| $V_{TX-CM-DC-ACTIVE-IDLE-DELTA}$ | Absolute Delta of DC Common Mode Voltage during L0 and Electrical Idle           | 0 (min)<br>100 (max)  | 0 (min)<br>100 (max)  | 0 (min)<br>100 (max)   | mV    | $ V_{TX-CM-DC} [during L0] - V_{TX-CM-DC} [during Electrical Idle]  \leq 100mV$<br>$V_{TX-CM-DC} = DC_{(avg)} \text{ of }  V_{TX-D+} + V_{TX-D-} /2$<br>$V_{TX-CM-DC} = DC_{(avg)} \text{ of }  V_{TX-D+} + V_{TX-D-} /2 [Electrical Idle]$   |
| $V_{TX-CM-DC-LINE-DELTA}$        | Absolute Delta of DC Common Mode Voltage between D+ and D-                       | 0 (min)<br>25 (max)   | 0 (min)<br>25 (max)   | 0 (min)<br>25 (max)    | mV    | $ V_{TX-CM-DC-D+} [during L0] - V_{TX-CM-DC-D-} [during L0]  \leq 25mV$<br>$V_{TX-CM-DC-D+} = DC_{(avg)} \text{ of }  V_{TX-D+}  [during L0]$<br>$V_{TX-CM-DC-D-} = DC_{(avg)} \text{ of }  V_{TX-D-}  [during L0]$   |
| $V_{TX-IDLE-DIFF-AC-p}$          | Electrical Idle Differential Peak Output Voltage                                 | 0 (min)<br>20 (max)   | 0 (min)<br>20 (max)   | 0 (min)<br>20 (max)    | mV    | $V_{TX-IDLE-DIFF-AC-p} =  V_{TX-IDLE-D+} - V_{TX-IDLE-D-}  \leq 20mV$ . Voltage must be band pass filtered to remove any DC component and HF noise. The bandpass is constructed from two first-order filters, the high pass and low pass 3dB bandwidths are 10 kHz and 1.25 GHz respectively.                     |
| $V_{TX-IDLE-DIFF-DC}$            | DC Electrical Idle Differential Output Voltage                                   | Not specified         | 0 (min)<br>5 (max)    | 0 (min)<br>5 (max)     | mV    | $V_{TX-IDLE-DIFF-DC} =  V_{TX-IDLE-D+} - V_{TX-IDLE-D-}  \leq 5mV$ . Voltage must be low pass filtered to remove any AC component. The low pass filter is first-order with a 3dB bandwidth of 10 kHz.   |
| $V_{TX-RCV-DETECT}$              | The amount of voltage change allowed during Receiver Detection                   | 600 (max)             | 600 (max)             | 600 (max)              | mV    | The total amount of voltage change in a positive direction that a Transmitter can apply to sense whether a low impedance Receiver is present. Note: Receivers display substantially different impedance for $V_{IN} < 0$ vs $V_{IN} > 0$ . See PCI Express Base Specification Revision 3.1, Table 4-24 for detail |
| $T_{TX-IDLE-MIN}$                | Minimum time spent in Electrical Idle  | 20 (min)              | 20 (min)              | 20 (min)               | ns    | Minimum time a Transmitter must be in Electrical Idle.  |
| $T_{TX-IDLE-SET-TO-IDLE}$        | Maximum time to transition to a valid Electrical Idle after sending an EIOS      | 8 (max)               | 8 (max)               | 8 (max)                | ns    | After sending the required number of EIOSs, the Transmitter must meet all Electrical Idle specifications within this time. This is measured from the end of the last UI of the last EIOS to the Transmitter in Electrical Idle.   |
| $T_{TX-IDLE-TO-DIFF-DATA}$       | Maximum time to transition to valid diff signaling after leaving Electrical Idle | 8 (max)               | 8 (max)               | 8 (max)                | ns    | Maximum time to transition to valid diff signaling after leaving Electrical Idle. This is considered a debounce time to the Tx.   |
| $T_{CROSSLINK}$                  | Crosslink random timeout   | 1.0 (max)             | 1.0 (max)             | 1.0 (max)              | ms    | This random timeout helps resolve potential conflicts in the crosslink configuration.   |
| $L_{TX-SKEW}$                    | Lane-to-Lane Output Skew   | 500 ps + 2 UI (max)   | 500 ps + 4 UI (max)   | 500 ps + 6 UI          | ps    | Between any two Lanes within a single Transmitter.  |
| $C_{TX}$                         | AC Coupling Capacitor  | 75 (min)<br>265 (max) | 75 (min)<br>265 (max) | 176 (min)<br>265 (max) | nF    | All Transmitters shall be AC coupled. The AC coupling is required wither within the media or within the transmitting component itself. See Note 14.   |

Note:

- SSC permits a +0, -5000ppm modulation of the clock frequency ar a modulation rate not to exceed 33 kHz.

2. Measurements at 5.0 GT/s require an oscilloscope with a bandwidth of  $\geq 12.5$  GHz, or equivalent, while measurements made at 2.5 GT/s require a scope with a least 6.2 GHz bandwidth. Measurement at 5.0 GT/s must deconvolve effects of compliance test board to yield an effective measurement at Tx pins. 2.5 GT/s may be measured within 200 mils of Tx device's pins, although deconvolution is recommended. For measurement setup details, refer PCI Express Base Specification Revision 3.1, Figure 4-32 to and Figure 4-33. At least  $10^6$  UI of data must be acquired.
3. Transmitter jitter is measured by driving the Transmitter under test with a low jitter "ideal" clock and connecting the DUT to a reference load.
4. Transmitter raw jitter data must be convolved with a filtering function that represents the worst case CDR tracking BW. 2.5 GT/s and 5.0 GT/s use different filter functions that are defined in PCI Express Base Specification Revision 3.1, Figure 4-49. After the convolution process has been applied, the center of the resulting eye must be determined and used as a reference point for obtaining eye voltage and margins.
5.  $V_{TX-AC-CM-PP}$  and  $V_{TX-AC-CM-P}$  are defined in PCI Express Base Specification Revision 3.1, Section 4.3.3.2. Measurement is made over at least  $10^6$  UI.
6. The Tx PLL Bandwidth must lie between the min and max ranges given in the above table. PLL peaking must lie below the value listed above. Note: the PLL B/W extends from zero up to the values(s) specified in the above table.
7. Measurements are made for both common mode and differential return loss. The DUT must be powered up and DC isolated, and its data+/data-output must be in the low-Z state at a static value.
8. A single combination of PLL BW and peaking is specified for 2.5 GT/s implementations. For 5.0 GT/s, two combinations of PLL BW and peaking are specified to permit designers to make a tradeoff between the two parameters. If the PLL's min BW is  $\geq 8$  MHz, then up to 3.0 dB of peaking is permitted. If the PLL's min BW is relaxed to  $\geq 5.0$  MHz, then a tighter peaking value of 1.0 dB must be met. In both cases, the max PLL BW is 16 MHz.
9. Reduced swing output, defined by  $V_{TX-DIFF-PP-LOW}$  must be implemented as shown in PCI Express Base Specification Revision 3.1, Figure 4-37 with no de-emphasis.
10. For 5.0 GT/s, de-emphasis timing jitter must be removed. An additional HPF function must be applied as shown in PCI Express Base Specification Revision 3.1, Figure 4-49. This parameter is measured by accumulating a record length of  $10^6$  UI while the DUT outputs a compliance pattern.  $T_{MIN-PULSE}$  is defined to be nominally 1 UI wide and is bordered on both sides by pulses of the opposite polarity. Refer to PCI Express Base Specification Revision 3.1, Figure 4-38.
11. Root Complex Tx de-emphasis is configured from Upstream controller. Downstream Tx de-emphasis is set via a command, issued at 2.5 GT/s. For detail, refer to the appropriate location in PCI Express Base Specification Revision 3.1, Section 4.2.
12. Tx CM noise for 8.0 GT/s is measured at TP1 without de-embedding the breakout channel. The parameter captures device CM noise only and is not intended to capture system CM noise. For 5.0 GT/s an LPF with a -3 dB corner at 2.5 GHz is applied to the raw data. For 8.0 GT/s the filter's -3 dB corner is at 4.0 GHz.
13.  $I_{TX-SHORT}$  and  $V_{TX-DC-CM}$  stipulate the maximum current/voltage levels that a transmitter can generate and therefore define the worst case transients that a receiver must tolerate.
14. All platforms that have transmitters supporting 8.0 GT/s must implement the 176-265 nF  $C_{TX}$  value. Platforms operating at 2.5 or 5.0 GT/s only may implement over a range of 75 to 265 nF.

**Table 12-7 8.0 GT/s Specific Tx Voltage and Jitter Parameters**

| Symbol              | Parameter                                | Value                    | Units              | Notes  |
|---------------------|--|--------------------------|--------------------|--|
| $V_{TX-FS-NO-EQ}$   | Full swing Tx voltage with no TxEq       | 1300 (max)<br>800 (min)  | mVPP               | See Note 1.  |
| $V_{TX-RS-NO-EQ}$   | Reduced swing Tx voltage with no TxEq    | 1300 (max)               | mVPP               | See Note 1.  |
| $V_{TX-EIEOS-FS}$   | Min swing during EIEOS for full swing    | 250 (min)                | mVPP               | See Note 2.  |
| $V_{TX-EIEOS-RS}$   | Min swing during EIEOS for reduced swing | 232 (min)                | mVPP               | See Note 2.  |
| $T_{TX-UTJ}$        | Tx uncorrelated total jitter             | 31.25 (max)              | Ps PP @ $10^{-12}$ |  |
| $T_{TX-UDJDD}$      | Tx uncorrelated deterministic jitter     | 12 (max)                 | Ps PP              |  |
| $T_{TX-UPW-TJ}$     | Total uncorrelated PWJ                   | 24 (max)                 | Ps PP @ $10^{-12}$ | See Notes 3 and 4.   |
| $T_{TX-UPW-DJDD}$   | Deterministic DjDD uncorrelated PWJ      | 10 (max)                 | Ps PP              | See Notes 3 and 4.   |
| $T_{TX-DDJ}$        | Data dependent jitter                    | 18 (max)                 | Ps PP              | See Notes 4 and 5.   |
| $Ps21_{TX}$         | Pseudo package loss                      | -3.0 (min)               | dB                 | PP ratio of 64 ones/64 zeroes pattern vs. 0101 pattern. No Tx equalization. See Note 6.                            |
| $V_{TX-BOOST-FS}$   | Tx boost ratio for full swing            | 8.0 (min)                | dB                 | Assumes $\pm 1.5$ dB tolerance from diagonal elements in PCI Express Base Specification Revision 3.1, Figure 4-45. |
| $V_{TX-BOOST-RS}$   | Tx boost ratio for reduced swing         | 2.5 (min)                | dB                 | Assumes $\pm 1.0$ dB tolerance from diagonal elements in PCI Express Base Specification Revision 3.1, Figure 4-45. |
| $EQ_{TX-COEFF-RES}$ | Tx coefficient resolution                | 1/24 (max)<br>1/63 (min) | N/A                |  |

Note:

1. Voltage measurements for  $V_{TX-FS-NO-EQ}$  and  $V_{TX-RS-NO-EQ}$  are made using the 64-zeroes/64-ones pattern in the compliance pattern.
2. Voltage limits comprehend both full swing and reduced swing modes. The Tx must reject any changes that would violate this specification. The maximum level is covered in the  $V_{TX-FS-NO-EQ}$  measurement which represents the maximum peak voltage the Tx can drive. The  $V_{TX-EIEOS-FS}$  and  $V_{TX-EIEOS-RS}$  voltage limits are imposed to guarantee the EIEOS threshold of 175 mVPP at the Rx pin. This parameter is measured using the actual EIEOS pattern that is part of the compliance pattern and then removing the ISI contribution of the breakout channel. The transmitter must advertise a value for LF during TS1 at 8.0 GT/s that ensures that these parameters are met.

3. PWJ parameters shall be measured after DDJ separation.
4. Measured with optimized preset value after de-embedding to Tx pin.
5. The 18 ps number takes into account measurement error.
6. The -3.0 dB number takes into account measurement error. For some Tx package/driver combinations  $ps_{21TX}$  may be greater than 0 dB.

## 12.6 COMMON RECEIVER PARAMETERS

The following table defines the parameters for 2.5 GT/s, 5.0 GT/s, and 8.0 GT/s Receivers.

**Table 12-8 Receiver Specifications**

| Symbol                            | Parameter   | 2.5 GT/s                     | 5.0 GT/s                       | 8.0GT/s                          | Units | Comments  |
|-----------------------------------|---|------------------------------|--------------------------------|----------------------------------|-------|---|
| UI                                | Unit Interval   | 399.88 (min)<br>400.12 (max) | 199.94 (min)<br>200.06 (max)   | 124.9625 (min)<br>125.0375 (max) | ps    | UI does not account for SSC caused variations.  |
| $V_{RX-DIFF-PP-CC}$               | Differential Rx peak-peak voltage for common Refclk Rx architecture | 0.175 (min)<br>1.2 (max)     | 0.120 (min)<br>1.2 (max)       | See                              | V     | See PCI Express Base Specification Revision 3.1, Section 4.3.7.3.2.   |
| $V_{RX-DIFF-PP-DC}$               | Differential Rx peak-peak voltage for data clocked Rx architecture  | 0.175 (min)<br>1.2 (max)     | 0.100 (min)<br>1.2 (max)       | See Table 12-11 and Table 12-12  | V     | See PCI Express Base Specification Revision 3.1, Section 4.3.7.3.2.   |
| $T_{RX-EYE}$                      | Receiver eye time opening   | 0.40 (min)                   | See Table 12-9 and Table 12-10 | See Table 12-11 and Table 12-12  | UI    | Minimum eye time at Rx pins to yield a $10^{-12}$ BER. See Note 1.  |
| $T_{RX-TJ-CC}$                    | Max Rx inherent timing error  | N/A                          | 0.40 (max)                     | See Table 12-11 and Table 12-12  | UI    | Max Rx inherent total timing error for common Refclk Rx architecture. See Note 2.                                 |
| $T_{RX-TJ-DC}$                    | Max Rx inherent timing error  | N/A                          | 0.34 (max)                     | See Table 12-11 and Table 12-12  | UI    | Max Rx inherent total timing error for data clocked Rx architecture. See Note 2.                                  |
| $T_{RX-DJ-DD-CC}$                 | Max Rx inherent deterministic timing error                          | N/A                          | 0.30 (max)                     | See Table 12-11 and Table 12-12  | UI    | Max Rx inherent deterministic timing error for common Refclk Rx architecture. See Note 2.                         |
| $T_{RX-DJ-DD-DC}$                 | Max Rx inherent deterministic timing error                          | N/A                          | 0.24 (max)                     | See Table 12-11 and Table 12-12  | UI    | Max Rx inherent deterministic timing error for data clocked Rx architecture. See Note 2.                          |
| $T_{RX-EYE-MEDIAN-10-MAX-JITTER}$ | Max time delta between median and deviation from median             | 0.3 (max)                    | Not specified                  | Not specified                    | UI    | Only specified for 2.5 GT/s.  |
| $T_{RX-MIN-PULSE}$                | Minimum width pulse at Rx   | Not specified                | 0.6 (min)                      | Not specified                    | UI    | Measured to account for worst Tj at $10^{-12}$ BER. See PCI Express Base Specification Revision 3.1, Figure 4-38. |
| $V_{RX-MAX-MIN-RATIO}$            | Min/max pulse voltage on consecutive UI                             | Not specified                | 5 (max)                        | Not specified                    | -     | Rx eye must simultaneously meet $V_{RX-EYE}$ limits.  |
| $BW_{RX-PLL}$                     | Rx PLL BW for 2.5 GT/s  | 22 (max)<br>1.5 (min)        | Not specified                  | Not specified                    | MHz   | See Note 3.   |
| $BW_{RX-PKG-PLL1}$                | Rx PLL bandwidth corresponding to $PKG_{RX-PLL1}$                   | Not specified                | 16 (max)<br>8 (min)            | 4 (max)<br>2 (min)               | MHz   | Second order PLL jitter transfer bounding function. See Note 3.   |
| $BW_{RX-PKG-PLL2}$                | Rx PLL bandwidth corresponding to $PKG_{RX-PLL2}$                   | Not specified                | 16 (max)<br>5 (min)            | 5 (max)<br>2 (min)               | MHz   | Second order PLL jitter transfer bounding function. See Note 3.   |
| $PKG_{RX-PLL1}$                   | Rx PLL peaking limit #1   | Not specified                | 3.0 (max)                      | 2.0 (max)                        | dB    | PLL BW = 8 MHz (min) @ 5.0 GT/s or BW = 4 MHz (max) @ 8.0 GT/s. See Note 3.                                       |
| $PKG_{RX-PLL2}$                   | Rx PLL peaking limit #2   | Not specified                | 1.0 (max)                      | 1.0 (max)                        | dB    | PLL BW = 5 MHz (min) @ 5.0 GT/s or BW = 5 MHz (max) @ 8.0 GT/s. See Note 3.                                       |
| $RL_{RX-DIFF}$                    | Rx package plus   | 10 (min)                     | 10 (min) for                   | 10 (min) for                     | dB    | See PCI Express Base  |

| Symbol                                  | Parameter  | 2.5 GT/s              | 5.0 GT/s   | 8.0GT/s   | Units | Comments   |

| Z <sub>RX-DC</sub>                      | Receiver DC single ended impedance                                 | 40 (min)<br>60 (max)  | 40 (min)<br>60 (max)                               | Not specified   | Ω     | DC impedance limits are needed to guarantee Receiver detect. For 8.0 GT/s is bounded by RL <sub>RX-CM</sub> . See Note 5.  |
| T <sub>RX-GND-FLOAT</sub>               | Rx termination ground float time                                   | Not specified         | Not specified                                      | 500   | μs    | Time allowed to float Rx internal ground in 2.5 GT/s/<br>5.0 GT/s to 8.0 GT/s configuration change. See Note 8.  |
| Z <sub>RX-DIFF-DC</sub>                 | DC differential impedance  | 80 (min)<br>120 (max) | Not specified                                      | Not specified   | Ω     | For 5.0 GT/s and 8.0 GT/s covered under the RL <sub>RX-DIFF</sub> parameter. See Note 5.   |
| V <sub>RX-CM-AC-P</sub>                 | Rx AC common mode voltage  | 150 (max)             | 150 (max)  | 75 mV (max)<br>(EH < 100<br>mVPP)<br>125 mV (max)<br>(EH < 100<br>mVPP).<br>See Table 12-11 | mVP   | Measured at Rx pins into a pair of 50 Ω terminations into ground. See Note 6.  |
| Z <sub>RX-HIGH-IMP-DC-POS</sub>         | DC input CM Input Impedance for V > 0 during Reset or power down   | ≥10 k or<br>≥20 k     | ≥10 k or<br>≥20 k                                  | ≥10 k or<br>≥20 k   | Ω     | Rx DC CM impedance with the RX terminations not powered. ≥10 kΩ over 0-200 mV range wrt. Ground and ≥20 kΩ for voltages ≥200 mV wrt ground. See Note 9.  |
| Z <sub>RX-HIGH-IMP-DC-NEG</sub>         | DC input CM input Impedance for V < 0 during Reset or power down   | 1.0 k (min)           | 1.0 k (min)  | 1.0 k (min)   | Ω     | Rx DC CM impedance with the Rx terminations not powered, measured over the range -150 to 0 mV with respect to ground. See Note 7.  |
| V <sub>RX-IDLE-DET-DIFF-P</sub>         | Electrical Idle Detect Threshold                                   | 65 (min)<br>175 (max) | 65 (min)<br>175 (max)                              | 65 (min)<br>175 (max)   | mV    | $V_{RX-IDLE-DET-DIFF-P} = 2^* V_{RX-D+} - V_{RX-D-} $ . Measured at the package pins of the Receiver. See PCI Express Base Specification Revision 3.1, Section 4.2.4.3.                                      |
| T <sub>RX-IDLE-DET-DIFF-ENTERTIME</sub> | Unexpected Electrical Idle Enter Detect Threshold Integration Time | 10 (max)              | 10 (max)   | 10 (max)  | ms    | An unexpected Electrical Idle (V <sub>RX-DIFF-PP</sub> < V <sub>RX-IDLE-DET-DIFF-P</sub> ) must be recognized on longer than T <sub>RX-IDLE-DET-DIFF-ENTERTIME</sub> to signal an unexpected idle condition. |
| L <sub>RX-SKEW</sub>                    | Lane to Lane skew  | 20 (max)              | 8 (max)  | 6 (max)   | ns    | Across all Lanes on a Ports. L <sub>RX-SKEW</sub> comprehends Lane-Lane variations due to channel and repeater delay differences.  |

**Note:**

- Receiver eye margins are defined into a 2x 50 Ω reference load.
- The four inherent timing error parameters are defined for the convenience of Rx designers, and they are measured during Receiver tolerancing.
- Two combinations of PLL BW and peaking are specified at ≥5.0 GT/s to permit designers to make tradeoffs between the two parameters. If the PLL's min BW is ≥8 MHz, then up to 3.0 dB of peaking is permitted. If the PLL's min BW is relaxed to ≥5.0MHz, then a tighter peaking value of 1.0 dB must be met. Note: a PLL BW extends from zero up to value(s) defined as the min or max in the above table. For 2.5 GT/s a single PLL bandwidth and peaking value of 1.5-22 Mhz and 3.0 dB are defined.
- Measurements must be made for both common mode and differential return loss. In both cases the DUT must be powered up and DC isolated, and its D+/D- inputs must be in the low-Z state.
- The Rx DC single ended impedance must be present when the Receiver terminations are first enabled to ensure that the Receiver Detect occurs properly. Compensation of this impedance can start immediately and the Rx Common Mode Impedance (Constrained by RL<sub>RX-CM</sub> to 50 Ω ±20%) must be within the specified range by the time Detect is entered.
- Common mode peak voltage is defined by the expression:  $\max\{|(V_{D+}-V_{D-}) - V_{CMDC}\}$ .

- $Z_{RX-HIGH-IMP-DC-NEG}$  and  $Z_{RX-HIGH-IMP-DC-POS}$  are defined respectively for negative and positive voltages at the input of the Receiver. Transmitter designers need to comprehend the large difference between  $>0$  and  $<0$  Rx impedances when designing Receiver detect circuits.
- Defines the time for the receiver's input pads to settle to new common-mode on 2.5 GT/s/5.0 GT/s transition to 8.0 GT/s.
- For voltage  $>500$  mV the effects of Rx ESD structures may limit  $Z_{RX-HIGH-IMP-DC-POS}$  to values less than 20 K $\Omega$ .

**Table 12-9 5.0 GT/s Tolerancing Limits for Common Refclk Rx Architecture**

| Parameter              | Description  | Min    | Max    | Units        | Notes                       |
|------------------------|--|--------|--------|--------------|-----------------------------|
| UI                     | Unit interval without including of SSC                         | 199.94 | 200.06 | ps           | Over $10^6$ UI              |
| $T_{RX-HF-RMS}$        | 1.5 – 100 MHz RMS jitter                                       |        | 3.4    | ps RMS       | Spectrally flat, see Note 3 |
| $T_{RX-HF-DJ-DD}$      | Max Dj impinging on Rx under test                              |        | 88     | ps           | See Notes 2 and 4           |
| $T_{RX-SSC-RES}$       | 33 kHz Refclk residual   | --     | 75     | ps           |                             |
| $T_{RX-LF-RMS}$        | < 1.5 MHz RMS jitter   | --     | 4.2    | ps RMS       | Spectrally flat             |
| $T_{RX-MIN-PULSE}$     | Minimum single pulse applied at Rx                             | 120    |        | ps           | See Note 2                  |
| $V_{RX-MIN-MAX-RATIO}$ | Min/max pulse voltage ratio seen over an time interval of 2 UI | --     | 5      |              | See Note 2                  |
| $V_{RX-EYE}$           | Receive eye voltage opening                                    | 120    |        | mVPP<br>diff | See Notes 1 and 3           |
| $V_{RX-CM-CH-SRC}$     | Common mode noise from Rx                                      | --     | 300    | mVPP         | See Note 2                  |

Note:

- Refer to PCI Express Base Specification Revision 3.1, Figure 4-63 for a description of how the Rx eye voltage is defined.
- Accumulated over  $10^6$  UI.
- Minimum eye is obtained by first injecting maximum Dj and then adjusting Rj until a minimum eye (defined by  $T_{RX-EYE}$  as show in PCI Express Base Specification Revision 3.1, Figure 4-63) is reached. Rj is spectrally flat before being filtered with a BPF having 3 dB cut-offs  $f_{C-LOW}$  and  $f_{C-HIGH}$  of 1.5 MHz and 100 MHz, respectively with step rolloff at 1.5 MHz and a 20 dB/decade rolloff on the high side. Minimum eye width is defined for a sample size equivalent to a BER of  $10^{-12}$ .
- Different combinations of  $T_{RX-HF-DJ-DD}$  and  $T_{RX-HF-RMS}$  are needed to measure  $T_{RX-TJ-CC}$  and  $T_{RX-DJ-DD-CC}$ .

**Table 12-10 5.0 GT/s Tolerancing Limits for Data Clocked Rx Architecture**

| Parameter              | Description  | Min    | Max    | Units        | Notes                       |
|------------------------|--|--------|--------|--------------|-----------------------------|
| UI                     | Unit interval without including of SSC                         | 199.94 | 200.06 | ps           | Over $10^6$ UI              |
| $T_{RX-HF-RMS}$        | 1.5 – 100 MHz RMS jitter                                       |        | 4.2    | ps RMS       | Spectrally flat, see Note 3 |
| $T_{RX-HF-DJ-DD}$      | Max Dj impinging on Rx under test                              |        | 88     | ps           | See Notes 2 and 4           |
| $T_{RX-SSC-RES}$       | 33 kHz Refclk residual   | --     | 20     | ps           |                             |
| $T_{RX-LF-RMS}$        | < 1.5 MHz RMS jitter   | --     | 8.0    | ps RMS       | Spectrally flat             |

| $V_{RX-MIN-MAX-RATIO}$ | Min/max pulse voltage ratio seen over an time interval of 2 UI | --     | 5      |              | See Note 2                  |
| $V_{RX-EYE}$           | Receive eye voltage opening                                    | 120    |        | mVPP<br>diff | See Notes 1 and 3           |
| $V_{RX-CM-CH-SRC}$     | Common mode noise from Rx                                      | --     | 300    | mVPP         | See Note 2                  |

Note:

- Refer to PCI Express Base Specification Revision 3.1, Figure 4-63 for a description of how the Rx eye voltage is defined.
- Accumulated over  $10^6$  UI.
- Minimum eye is obtained by first injecting maximum Dj and then adjusting Rj until a minimum eye (defined by  $T_{RX-EYE}$  as show in PCI Express Base Specification Revision 3.1, Figure 4-63) is reached. Rj is spectrally flat before being filtered with a BPF having 3 dB cut-offs  $f_{C-LOW}$  and  $f_{C-HIGH}$  of 1.5 MHz and 100 MHz, respectively with step rolloff at 1.5 MHz and a 20 dB/decade rolloff on the high side. Minimum eye width is defined for a sample size equivalent to a BER of  $10^{-12}$ .
- Different combinations of  $T_{RX-HF-DJ-DD}$  and  $T_{RX-HF-RMS}$  are needed to measure  $T_{RX-TJ-CC}$  and  $T_{RX-DJ-DD-CC}$ .

**Table 12-11 Stressed Voltage Eye Parameters**

| Symbol             | Parameter                | Limits at 8.0GT/s   | Units | Comments  |
|--------------------|--------------------------|---|-------|---|
| $V_{RX-LAUNCH-8G}$ | Generator launch voltage | 800   | mVPP  | Measured at TP1. Please refer to PCI Express Base Specification Revision 3.1, Figures 4-65. $V_{RX-LAUNCH-8G}$ may be adjusted if necessary to yield the proper EH as long as the outside eye voltage at TP2 does not exceed 1300 mVPP. |
| $T_{RX-UI-8G}$     | Unit Interval            | 125.00  | ps    | Nominal value is sufficient for Rx tolerancing. Value does not account for SSC.   |
| $V_{RX-SV-8G}$     | Eye height at TP2P       | 25 (-20 dB channel)<br>50 (-12 dB channel)<br>200 (-3 dB channel) | mVPP  | Eye height @ BER = $10^{-12}$ . See Notes 1 and 2.  |

| Symbol                     | Parameter                         | Limits at 8.0GT/s                          | Units  | Comments  |
|----------------------------|-----------------------------------|--|--------|---|
| T <sub>RX-SV-8G</sub>      | Eye width at TP2P                 | 0.3 to 0.35                                | UI     | Eye width at BER = 10 <sup>-12</sup> . See Note 2.      |
| V <sub>RX-SV-DIFF-8G</sub> | Differential mode interference    | 14 or greater                              | mVPP   | Adjusted to set EH/ Frequency = 2.10 GHz. See Note 3.   |
| V <sub>RX-SV-CM-8G</sub>   | Rx AC Common mode voltage at TP2P | 150 (EH < 100 mVPP)<br>250 (EH ≥ 100 mVPP) | mVPP   | Defined for a single tone at 120 MHz. See Note 3.       |
| T <sub>RX-SV-SJ-8G</sub>   | Sinusoidal Jitter at 100 MHz      | 0.1  | UI PP  | Fixed at 100 MHz. See Note 4.                           |
| T <sub>RX-SV-RJ-8G</sub>   | Random Jitter                     | 2.0  | Ps RMS | Rj spectrally flat before filtering. See Notes 4 and 5. |
| V <sub>RX-MAX-SE-SW</sub>  | Max single-ended swing            | ±300                                       | mVP    | See Note 6.   |

Note:

- V<sub>RX-SV-8G</sub> is tested at three different voltages to ensure the Rx DUT is capable of equalizing over range of channel loss profiles. The test also guarantees the Rx is capable of operating over a sufficient dynamic range of eye heights. This “SV” in the parameter names refers to stressed voltage.
- V<sub>RX-ST-8G</sub> and T<sub>RX-ST-8G</sub> are referenced to TP2P and are obtained after post processing data captured at TP2. V<sub>RX-ST-8G</sub> and T<sub>RX-ST-8G</sub> include the effects of applying the behavioral Rx model and Rx behavioral equalization.
- V<sub>RX-SV-DIFF-8G</sub> measurement is made at TP2 without post processing. V<sub>RX-SV-CM-8G</sub> may be made at either TP1 or TP2. V<sub>RX-SV-DIFF-8G</sub> voltage may need to be adjusted over a wide range for the different loss calibration channels.
- T<sub>RX-SV-SJ-8G</sub> and T<sub>RX-SV-RJ-8G</sub> measurements are made at TP1 without post processing.
- Rj is applied over the following range. The low frequency limit may be between 1.5 and 10 MHz, and the upper limit is 1.0GHz. See PCI Express Base Specification Revision 3.1, Figure 4-47 for details.
- V<sub>RX-MAX-SE-SW</sub> sets the maximum outer, single-ended eye voltage limit in the presence of differential and CM noise applied to the Rx, as observed at TP2 relative to ground with no behavioral RxEq post processing.

**Table 12-12 Stressed Jitter Eye Parameters**

| Symbol                    | Parameter                | Limits at 8.0GT/s    | Units  | Comments  |
|---------------------------|--------------------------|----------------------|--------|---|
| V <sub>RX-LAUNCH-8G</sub> | Generator launch voltage | 800 (nominal)        | mVPP   | Measured at TP1, See PCI Express Base Specification Revision 3.1, Figure 4-65 and Note 1. |
| T <sub>RX-UI-8G</sub>     | Unit Interval            | 125.00               | ps     | Nominal value is sufficient for Rx tolerancing. Value does not account for SSC.           |
| V <sub>RX-ST-8G</sub>     | Eye height at TP2P       | 25 (min)<br>35 (max) | mVPP   | At BER = 10 <sup>-12</sup> . See Note 2.  |
| T <sub>RX-ST-8G</sub>     | Eye width at TP2P        | 0.30                 | UI     | At BER = 10 <sup>-12</sup> . See Note 2.  |
| T <sub>RX-ST-SJ-8G</sub>  | Sinusoidal Jitter        | 0.1 - 1.0            | UI PP  | See PCI Express Base Specification Revision 3.1, Figure 4-74 Measured at TP1. See Note 3. |
| T <sub>RX-ST-RJ-8G</sub>  | Random Jitter            | 3.0                  | ps RMS | Rj spectrally flat before filtering. Measured at TP1, See Note 4.                         |

Note:

- V<sub>RX-SV-8G</sub> may be adjusted to meet V<sub>RX-ST-8G</sub> as long as the outside eye voltage at TP2 does not exceed 1300 mVPP.
- V<sub>RX-ST-8G</sub> and T<sub>RX-ST-8G</sub> are referenced to TP2P and are obtained after post processing data captured at TP2. V<sub>RX-ST-8G</sub> and T<sub>RX-ST-8G</sub> include the effects of applying the behavioral Rx model and Rx behavioral equalization.
- T<sub>RX-ST-SJ-8G</sub> may be measured at either TP1 or TP2.
- While the nominal value is specified at 3.0 ps RMS, it may be adjusted to meet the 0.3 UI value for T<sub>RX-ST-8G</sub>. Rj is measured at TP1 to prevent data-channel interaction from adversely affecting the accuracy of the Rj calibration. Rj is applied over the following range. The low frequency limit may be between 1.5 and 10 MHz, and the upper limit is 1.0 GHz.

## 12.7 POWER CONSUMPTION

**Table 12-13 Power Consumption**

| Active Lane# | Link Speed (GT/s) | Tj (°C) | Process | 0.95VDDC    |           | 0.95VP      |           | 0.95CVDDC   |           | 1.8VDDR     |           | 1.8CVDDR    |           | 1.8VPH      |           | Total (W) |
|--------------|-------------------|---------|---------|-------------|-----------|-------------|-----------|-------------|-----------|-------------|-----------|-------------|-----------|-------------|-----------|-----------|
|              |                   |         |         | Current (A) | Power (W) | Current (A) | Power (W) | Current (A) | Power (W) | Current (A) | Power (W) | Current (A) | Power (W) | Current (A) | Power (W) |           |
| 16           | 8.0               | 25      | Typical | 1.91        | 1.81      | 1.01        | 0.96      | 0.01        | 0.01      | 0.01        | 0.02      | 0.06        | 0.11      | 0.27        | 0.49      | 3.40      |

Note:

- Power consumption measurement conditions:
  - Port Configuration: 816
  - Down Ports: Full-loading, 7 SSD cards plugged
- Power consumption in the table is a reference, be affected by various environments, bus traffic and power supply etc.
- Max power is at Tj=125°C and Fast/Fast (FF) process coner silicon

## 13 THERMAL DATA

Table 13-1 lists sample simulation thermal data for PI7C9X3G816GP at Industrial Temperature.

**Table 13-1 Sample Simulation Thermal Data**

| PCB Structure      | Airflow Velocity | $\Theta_{JA}$ (°C/W) | $\Psi_{JB}$ (°C/W) | $\Psi_{JT}$ (°C/W) | $\Theta_{JC}$ (°C/W) | Heat Sink       |
|--------------------|------------------|----------------------|--------------------|--------------------|----------------------|-----------------|
| Customized 10L PCB | Still air        | 6.54                 | 3.64               | 1.93               | 1.89                 | Alpha LPD40-25B |
|                    | Still air        | 10.98                | 5.84               | 1.69               |                      | No              |
|                    | 1 m/s            | 9.90                 | 5.69               | 1.72               |                      |                 |
|                    | 2 m/s            | 9.39                 | 5.57               | 1.73               |                      |                 |

**Note:**

1.  $\Theta_{JA}$ : Thermal Resistance, Junction-to-Ambient
2.  $\Theta_{JC}$ : Thermal Resistance, Junction-to-Case
3.  $\Psi_{JT}$ : Junction to top center thermal characterization
4.  $\Psi_{JB}$ : Junction to board thermal characterization
5. Thermal data is based upon simulation
6. Simulation conditions
  - PCB Condition: Customized 10L PCB
  - Substrate: 0.76 mm 8L
  - Thermal power dissipation: maximum power is assumed to be at 8.0 GT/s, as listed in Table 12-13.
  - Ambient temperature: 85°C
  - Thermal criteria: junction temperature < 125°C

# 14 PACKAGE INFORMATION

The package of PI7C9X3G816GP is a 19mm x 19mm HFCBGA (324 Pin) package with ball pitch 1.0mm. The detailed package information, mechanical dimension and package of drawing are shown below.

Figure 14-1 Package of Drawing

YY: Year  
 WW: Workweek  
 1st X: Assembly Code  
 2nd X: Fab Code  
 XXXXXXXX.\*\* = Assy Lot#

## 15 ORDERING INFORMATION

| Part Number        | Package Code | Package Description           | Pb-Free & Green |
|--------------------|--------------|-------------------------------|-----------------|
| PI7C9X3G816GPCHFCE | HFC          | 324-pin HFCBGA<br>19mm x 19mm | Yes             |

**Notes:**

1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.
